Subject: Comments for the Immunizations Technical Advisory Group

External Email

Good Morning,

I would like to submit my comments opposing inclusion of the COVID-19 vaccine requirement for children from daycare through Grade 12. My focus and objections are primarily for those that are younger, but the logic applies to all young children.

Studies have clearly shown that the benefit of the vaccine is minimal, if any, for young children in elementary school. Additionally, as the parent of a 6 year old, I can say, from first hand experience, that the effect of COVID on a 6 year old is minimal. My wife and I are vaccinated, but caught a mild breakthrough infection in early January of 2022, most likely with Omicron. We were mildly sick for 1.5 to 2 days. My daughter who is unvaccinated had a fever for a few hours one evening and was back to normal by morning. I also observed this in several of her school peers and cousins; they all had either no symptoms or a fever for a few hours. I believe I can live with that for my daughter. Kids have shared food and drink, removed masks, and acted like kids during the last year, and the vast majority have been fine.

At this point, I believe the risks of mandating vaccines for young children exponentially exceed the benefits. I believe in vaccines for adults and perhaps even for college age children, but not for little ones that get little or no benefit from these vaccines. Pfizer's own studies have shown that the benefit was minimal if any, and those results are often skewed to promote their products.

Risk to children include myocarditis, nerve damage, sore arms, and other ailments that we still do not know enough about. I do not believe we should do this to our children.

Thank you for listening to our feedback.

--

Glenn

To the board members and members voting on item 5 and item 6 in February 10, 2022 meeting, I am here as a mother and representing the community of Kent Washington.

You previously held a similar meeting where over 30,000 people sent emails or attended the zoom meeting. You heard our voices. We do NOT accept you making health decisions over us or our children.

We have provided you with studies and other sources of data that shows your agency is out of line and your decisions are political.

How dare you tell us to step aside and let the experts do their work?

We have seen your "science". I find it interesting that if we look directly at each hospital's Covid situation as far as ICU, general or death, your reports deviate quite a bit from theirs. It seems vaccinated are higher numbers than unvaccinated. Also, why are you including data from a year ago, when the virus has changed from delta to omicron as of December of 2021. Omicron is much less deadly so your statistics do not show current and real statistic for the variance we are dealing with.

We also now know that both vaccinated and unvaccinated spread and get Covid, at possibly a higher rate for the vaccinated. Have you done your due diligence and researched this number in this state?

And why are we relying on PCR Covid tests to build data, when FDA no longer find them reliable?

I do recommend that you attend Dr Malones seminar that is being held in Gig Harbor this month if you want to listen to experts.

He is far superior to any of you who call yourself experts. Look at his track record. In fact, I would love to see you having a panel discussion about vaccines with him. He can help you understand science.

Since your last public meeting, the world has changed. Millions of people are demonstrating against vaccine mandates and mask mandates all around the world. Convoy started in Canada and just today; Ontario declared removal of vaccine passport, and masks from children publicly and in school effective immediately.

Oregon is removing their mask mandate 3/31 or sooner.
California is planning to remove their mask mandates.

UK has removed their mandates.
Sweden has removed their mandates

These countries are currently planning or are in the midst of freedom convoys. Remember eyes are on you, and the world will know that you went against freedom of choice and they will know you forced children out of the school system. Because we will not comply.

While you are so concerned about the vaccine, you have forgotten about increased child and young adult suicide due to isolation, no school or on line schooling, mask cover, 6 feet distance to your friends, and loss of social life. You are not concerned about the mental health of Washington state citizens. Those who have lost their jobs in careers they were previously looked at as hero's. Some have 20+ years in the industry. Some are still paying of their school loan from a career that is now long gone. You have not looked at the health of those businesses that had to close temporarily or completely during the lockdown. You are forcing business owners to implement vaccine passports, while they are loosing thousands of dollars monthly in revenue due to lost business. Divorces and mental health issues are over the roof. You do not care about health, it has been proven. Instead you take advise from a governor who had placed himself in forever emergency power, CDC and FDA, two organizations that are highly financially involved with Pfizer and Moderna. Did you notice the same people sit on both boards?

Over and over, in federal courts and supreme court it has been ruled that mandating vaccine is unconstitutional.

Here are some facts. I doubt you will read the links but you have been informed. This is my notice.

You are trying to mandate a drug that is not FDA approved to children. This is illegal:

<https://crsreports.congress.gov/product/pdf/R/R46913>

<https://www.fda.gov/media/151710/download>

EUA - Sept 29, 2021 (Comirnaty vs. Pfizer/ BioNTech) shots - not the same

Listen to data about effectiveness of vaccine here:

<https://www.canadiancovidcarealliance.org/>

Injuries.... Lots of injuries

<https://www.covidvaccinevictims.com/>

Why does OSHA require fit testing, training, and safe disposal of respirators, but our school kids are just thrown in any old medical device as though all bodies are the same? "29 CFR 1910.134, Respiratory Protection Standard."

https://www.osha.gov/sites/default/files/enforcement/directives/CPL_02-00-158.pdf

A study of why school children should not get C shots.

<https://alethonews.com/2021/11/05/6-studies-showing-why-children-dont-need-and-shouldnt-get-a-covid-vaccine/>

Sweden's health department recommends children under 12 should not take the vaccine.

You giving yourself the "supreme right" to vote over the safety of our children is despicable. You are overstepping your authority by suggesting any medical advice for children that you have not medically evaluated as their physician, and so do the school boards and schools who enforce this requirement.

You MUST consider every student's medical needs. We the parents will make decisions relating to our children's health within our own families and with our own medical

providers.

And for Masks:

Lots of studies on mask Effectiveness:

<https://www.sciencedaily.com/releases/2015/04/150422121724.htm>

<https://pubmed.ncbi.nlm.nih.gov/25903751/>

<https://pubmed.ncbi.nlm.nih.gov/18500410/>

<https://pubmed.ncbi.nlm.nih.gov/33254499/>

<https://www.nejm.org/doi/full/10.1056/NEJMp2006372>

Info on children and masks:

<https://thehill.com/opinion/education/514742-masks-for-all-children-arent-needed-or-ethical>

<https://swprs.org/face-masks-evidence/>

Further more, child abuse is illegal:

section 1. vaccine injury (who will be responsible for a vaccine injury of a child? and section D; forcing children to wear masks.

While most other states in this country has removed restrictions and mandates and their children's lives has gone back to normal, Washington state children are being raised in fear, and being forced to comply with government and health official's over reach.

Have you seen all the thousands of vaccine injuries and deaths to athletes around the world? You are public figures, the world will hold you accountable. It takes only 1 proven vaccine death to charge you for murder, just like what happened in UK and what ultimately caused the restrictions to be removed in UK.

Start working on the real issues of mental health issues caused by this governments overreach and agencies like yours who support them.

Catrina

Subject: Covid-19 Vaccine Inclusion for Students

External Email

To Whom It May Concern,

I oppose vaccine inclusion for students in any education institution. There is very little to no evidence to suggest that the Covid-19 vaccine prevents transmission of the virus to others or that it protects children. Covid-19 is not a threat to the majority of students and they experience mild to zero symptoms of Covid-19. It is more risky for a child to receive an experimental mRNA vaccine than for a child to become infected with Covid-19. Further more, there is no current published literature on pediatric Covid-19 vaccine effectiveness in the K-12 setting. While suicide is the third leading cause of death in teenagers ages 15-19 in WA state, Covid-19 is far down the list of causes of death for children in Washington state. Due to this information and more I oppose vaccine inclusion/requirements for students to attend any education institution.

Thank you

There are many of us who do not support vaccination of our children or ourselves and will fight to protect our children from mandates. With all the required or recommended shots our children will already have had over 70 different vaccines by the time they are 18. This is frightening that science is regarded as overruling natural immunity of Creator's Design 100 % of the time.

Mandates are not going to save us when no education is perpetuated for keeping our bodies strong with organic food and proper nutrition. Where is this education for how to treat someone struggling to recover from sickness no matter how it is deemed to be spread? I declare that it is stymied by Industries of Capitalism. Many will be watching this debate and fighting to keep our bodies free of contamination we do not choose.

Subject: TAG Meeting 2/10/2022 Covid-19 Vaccine

External Email

To Whom It May Concern,

I am a concerned parent writing to the WA State Board of Health and the TAG Team, regarding the discussion about Covid-19 Vaccine and mandating it for children to attend any type of schooling or childcare in WA State.

I am against this mandate and it possibly becoming a WA State law.

The Covid-19 vaccine has not shown to completely stop the spread of Covid-19. I am aware that it could possibly reduce the virus symptoms. For the majority of children, the Covid-19 virus is not fatal. It would be wrong to mandate it, or make it a law to attend school, due to the fact that it doesn't stop the spread.

Since there are around 71% of WA state, of the age of over 5, that have the Covid-19 vaccine and many more that have had the virus and have natural immunity, it doesn't make sense to make it mandatory for those who choose to not get the vaccine.

I pray that you all take this into consideration, not everyone wants to get this vaccine. We still don't know the long term side effects of this vaccine in anyone. It is our constitutional rights as citizens in the United States of America and of Washington State, to choose what we want to do with our bodies.

Please vote no on making the Covid-19 vaccine mandatory or into law in order to attend school or any childcare in Washington State.

Sincerely,

Heidi von Olnhausen

Please enter your comments or questions in the space provided below:

I am urging you NOT to require covid vaccines for school attendance. We know vaccines do NOT stop the spread but may only help to not get as severe of infection. There is NO justification then as it will not change or affect covid spread. Natural immunity is more efficient and clearly with Omicron it does not matter if vaccinated or not in how fast it spreads. I know the 400 plus wrestlers were 95% plus vaccinated. I can not even imagine it would be legal to require given the scientific facts on lack of benefit to reduce spread and how effective natural immunity is and large majority of school kids already exposed so will have immunity. take a look at facts in Isreal right now. The vast majority of people have at least 1 if not 2 BOOSTERS and they are one of highest covid rates! CLEARLY vaccines not slowing the spread. There are risks with vaccines look it up on VAERS data. For kids who have had covid there is no benefit and with how generally mild omicron is our best chance to reach endemic state is not to keep vaccinating, its not working just helping some not to be severely ill. You would be penalizing so many kids for NO community benefit. You cannot take away personal choice for nothing especially for so many kids who have already had covid and are immune. I know many families in my office already looking and talking to lawyers. It is prejudice and irresponsible to require something that can cause harm and effects genes without having any benefit to the school community at large. Its like no one really wants to look at the facts. they ignore what's goin on in Israel and even seattle was one of highest Covid rates yet had high vaccination status. these vaccine do not work as well as we want to believe and again DO NOT STOP SPREAD. so there is no justification or benefit to the school community and could cause great harm to many children who are already behind due to the missing in person school. Shame on everyone for even thinking this is a good idea. Look up the facts quit causing our children harm. lets stop just assuming things I know we have all been brain washed into thinking vaccines will slow spread it is just not the truth. Yes they ay reduce hospitalizations but who knows on the long run if there may be harm to the immune system and how dare you think about taking a parents choice away without there being any benefit in stopping the spread. I fear for the harm this can do to so many and the legal battles tat will divide us even more.

Subject: No to Covid-19 Coronavirus Immunization Criteria

External Email

Hello, Washington State Board of Health,

I am writing to you to request you not to put the Covid-19/or/Coronavirus (seasonal flue) Vaccination as a requirement for children to go to school in Washington State. You know that what you are requiring is against the constitution and against science. You know you are pushing this against people's will. You know the Covid-19 vaccine is not a true vaccine and it has caused many injuries in young people and killed many. And you are still pushing it for your own benefit!!!! "NO" to Crimes Against Humanity! Consider yourself served.

Vote NO on mandatory covid-19/coronavirus vaccination now and always.

DO NO HARM! Hipocratic Oath!!!

I OPPOSE the use of illegal force to detain ANY family OR children. This is insane!! Have we not learned about the holocaust and internment camps? What you are trying to pass is illegal and unconstitutional! There are thousands of us trying to leave comments on this matter and we will continue. I will be on every zoom or meeting you have throughout this charade! I will comment every time because this is against Washington Constitution!!

There are studies that show this type of agenda does not reduce transmission whatsoever. I would love to hear your thoughts on the vaccinated still being able to get Covid and spread it. According to even more studies this plandemic didn't get out of hand until the experimental shots were starting to be administered.

Forced mandates opposes our rights as free Americans- it also disrupts an active healthy immune response. Many studies now conclude that the highest vaccinated areas are highest for deaths and risky health concerns. Freedom of choice should never be infringed upon.

THE PEOPLE HAVE SPOKEN AND WE THE PEOPLE SAY NO!

WE THE PEOPLE SAY NO!

Just in case you forgot, WE the PEOPLE saw the WAC 246-100-040 on the agenda you tried to hide.

The data on harms to children from the experimental gene therapy injections are mounting every day, including myocarditis in boys. You are well aware of the high incidence of the myocarditis and you are still driven to put this in every arm. The vaccines have failed. You are now more likely to get Covid, especially Omicron, if you are vaccinated than if you are not vaccinated. This must stop. It is no longer about Covid or injections.....this is about God given rights guaranteed in our Constitution. Stop the insanity.

We appreciate your grace in allowing us to view your meeting yesterday.

However, what we do not appreciate is the mockery presented in the beginning of your signaling before the meeting got under way.

There are citizens who will never go under the advisement of Health Boards, regardless.

Trying to mandate a vaccine such as COVID that shows merely profit through taxpayer's pay off (once again) is morally bankrupt.

It is honestly a real disappointment that we are exchanging expectations on a virus that is relatable to the flu.

We have lost people to this catastrophic occurrence, as with life, death occurs.

For you to NOT mandate COVID vaccines ever, should be forever consistent.

You DO NOT mandate something as simple as the FLU except in the military, which I find overboard & uncalled for there as well.

The most disturbing piece to this whole take over, is people cannot understand how to function with a bit of what we knew to be normalcy.

Anything from to interaction & connecting with other humans, to driving & common sense.

You have people so worked up, it is a continual intrusion on our lives.

IF any of your jobs were ever voted upon, I would hope that the registered voters of our state would vote accordingly.

However, seeing the current "leadership" in the Governor's office, I could be gravely mistaken.

I have not had COVID THIS WHOLE ORDEAL stemming back from late 2019.

I have utilized my natural antibodies to combat EVERYTHING else I may have encountered in my daily routine & interactions.

From performing my work with the public to going into stores, etc.

NOTHING still

I just took a test last night, due to ONLY concerns of others. And of course, I WAS NEGATIVE!!!!!!!

EVEN though I have an underperforming immune system, I WILL NEVER stop my life. NOT for COVID especially.

A great point is made over & over, why should we mandate this for US citizens, when your FED GOV is allowing massively infected non US citizens into our Country???

**A LITERATURE REVIEW AND META-ANALYSIS
OF THE EFFECTS OF LOCKDOWNS ON
COVID-19 MORTALITY**

Jonas Herby, Lars Jonung, and Steve H. Hanke

Johns Hopkins Institute for Applied Economics,
Global Health, and the Study of Business Enterprise

A Literature Review and Meta-Analysis of the Effects of Lockdowns on COVID-19 Mortality

By Jonas Herby, Lars Jonung, and Steve H. Hanke

About the Series

The *Studies in Applied Economics* series is under the general direction of Prof. Steve H. Hanke, Founder and Co-Director of The Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise (hanke@jhu.edu). The views expressed in each working paper are those of the authors and not necessarily those of the institutions that the authors are affiliated with.

About the Authors

Jonas Herby (herby@cepos.dk) is special advisor at Center for Political Studies in Copenhagen, Denmark. His research focuses on law and economics. He holds a master's degree in economics from University of Copenhagen.

Lars Jonung (lars.jonung@nek.lu.se) is professor emeritus in economics at Lund University, Sweden. He served as chairperson of the Swedish Fiscal Policy Council 2012-13, as research advisor at the European Commission 2000-2010, and as chief economic adviser to Prime Minister Carl Bildt in 1992-94. He holds a PhD in Economics from the University of California, Los Angeles.

Steve H. Hanke is a Professor of Applied Economics and Founder & Co-Director of The Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise. He is a Senior Fellow and Director of the Troubled Currencies Project at the Cato Institute, a contributor at National Review, a well-known currency reformer, and a currency and commodity trader. Prof. Hanke served on President Reagan's Council of Economic Advisers, has been an adviser to five foreign heads of state and five foreign cabinet ministers, and held a cabinet-level rank in both Lithuania and Montenegro. He has been awarded seven honorary doctorate degrees and is an Honorary Professor at four foreign institutions. He was President of Toronto Trust Argentina in Buenos Aires in 1995, when it was the world's best-performing mutual fund. Currently, he serves as Chairman of the Supervisory Board of Advanced Metallurgical Group N.V. in Amsterdam. In 1998, he was named one of the twenty-five most influential people in the world by World Trade Magazine. In 2020, Prof. Hanke was named a Knight of the Order of the Flag.

Abstract

This systematic review and meta-analysis are designed to determine whether there is empirical evidence to support the belief that “lockdowns” reduce COVID-19 mortality. Lockdowns are defined as the imposition of at least one compulsory, non-pharmaceutical intervention (NPI). NPIs are any government mandate that directly restrict peoples’ possibilities, such as policies that limit internal movement, close schools and businesses, and ban international travel. This study employed a systematic search and screening procedure in which 18,590 studies are identified that could potentially address the belief posed. After three levels of screening, 34 studies ultimately qualified. Of those 34 eligible studies, 24 qualified for inclusion in the meta-analysis. They were separated into three groups: lockdown stringency index studies, shelter-in-place-order (SIPO) studies, and specific NPI studies. An analysis of each of these three groups support the conclusion that lockdowns have had little to no effect on COVID-19 mortality. More specifically, stringency index studies find that lockdowns in Europe and the United States only reduced COVID-19 mortality by 0.2% on average. SIPOs were also ineffective, only reducing COVID-19 mortality by 2.9% on average. Specific NPI studies also find no broad-based evidence of noticeable effects on COVID-19 mortality.

While this meta-analysis concludes that lockdowns have had little to no public health effects, they have imposed enormous economic and social costs where they have been adopted. In consequence, lockdown policies are ill-founded and should be rejected as a pandemic policy instrument.

Acknowledgements

The authors thank Line Andersen, Troels Sabroe Ebbesen, Nicholas Hanlon, and Anders Lund Mortensen for their research assistance.

Key Words: COVID-19, lockdown, non-pharmaceutical interventions, mortality, systematic review, meta-analysis

JEL Classification: I18; I38; D19

1 Introduction

The global policy reaction to the COVID-19 pandemic is evident. Compulsory non-pharmaceutical interventions (NPIs), commonly known as “lockdowns” – policies that restrict internal movement, close schools and businesses, and ban international travel – have been mandated in one form or another in almost every country.

The first NPIs were implemented in China. From there, the pandemic and NPIs spread first to Italy and later to virtually all other countries, see Figure 1. Of the 186 countries covered by the Oxford COVID-19 Government Response Tracker (OxCGRT), only Comoros, an island country in the Indian Ocean, did not impose at least one NPI before the end of March 2020.

Figure 1: Share of countries with OxCGRT stringency index above thresholds, January - June 2020

Comment: The figure shows the share of countries, where the OxCGRT stringency index on a given date surpassed index 65, 70 and 75 respectively. Only countries with more than one million citizens are included (153 countries in total). The OxCGRT stringency index records the strictness of NPI policies that restrict people's behavior. It is calculated using all ordinal containment and closure policy indicators (i.e., the degree of school and business closures, etc.), plus an indicator recording public information campaigns.

Source: Our World in Data.

Early epidemiological studies predicted large effects of NPIs. An often cited model simulation study by researchers at the Imperial College London (Ferguson et al. (2020)) predicted that a

suppression strategy based on a lockdown would reduce COVID-19 mortality by up to 98%.¹ These predictions were questioned by many scholars. Our early interest in the subject was spurred by two studies. First, Atkeson et al. (2020) showed that “across all countries and U.S. states that we study, the growth rates of daily deaths from COVID-19 fell from a wide range of initially high levels to levels close to zero within 20-30 days after each region experienced 25 cumulative deaths.” Second, Sebhatu et al. (2020) showed that “government policies are strongly driven by the policies initiated in other countries,” and less by the specific COVID-19-situation of the country.

A third factor that motivated our research was the fact that there was no clear negative correlation between the degree of lockdown and fatalities in the spring of 2020 (see Figure 2). Given the large effects predicted by simulation studies such as Ferguson et al. (2020), we would have expected to at least observe a simple negative correlation between COVID-19 mortality and the degree to which lockdowns were imposed.²

Figure 2: Correlation between stringency index and COVID-19 mortality in European countries and U.S. states during the first wave in 2020

Source: Our World in Data

¹ With $R_0 = 2.4$ and trigger on 60, the number of COVID-19-deaths in Great Britain could be reduced to 8,700 deaths from 510,000 deaths (-98%) with a policy consisting of case isolation + home quarantine + social distancing + school/university closure, cf. Table 4 in Ferguson et al. (2020). R_0 (the basic reproduction rate) is the expected number of cases directly generated by one case in a population where all individuals are susceptible to infection.

² In addition, the interest in this issue was sparked by the work Jonung did on the expected economic effects of the SARS pandemic in Europe in 2006 (Jonung and Röger, 2006). In this model-based study calibrated from Spanish flu data, Jonung and Röger concluded that the economic effects of a severe pandemic would be rather limited—a sharp contrast to the huge economic effects associated with lockdowns during the COVID-19 pandemic.

Today, it remains an open question as to whether lockdowns have had a large, significant effect on COVID-19 mortality. We address this question by evaluating the current academic literature on the relationship between lockdowns and COVID-19 mortality rates.³ We use “NPI” to describe *any government mandate which directly restrict peoples’ possibilities*. Our definition does *not* include governmental recommendations, governmental information campaigns, access to mass testing, voluntary social distancing, etc., but *do* include mandated interventions such as closing schools or businesses, mandated face masks etc. We define *lockdown* as any policy consisting of at least one NPI as described above.⁴

Compared to other reviews such as Herby (2021) and Allen (2021), the main difference in this meta-analysis is that we carry out a systematic and comprehensive search strategy to identify all papers potentially relevant to answer the question we pose. We identify 34 eligible empirical studies that estimate the effect of mandatory lockdowns on COVID-19 mortality using a counterfactual difference-in-difference approach. We present our results in such a way that they can be systematically assessed, replicated, and used to derive overall meta-conclusions.⁵

2 Identification process: Search strategy and eligibility criteria

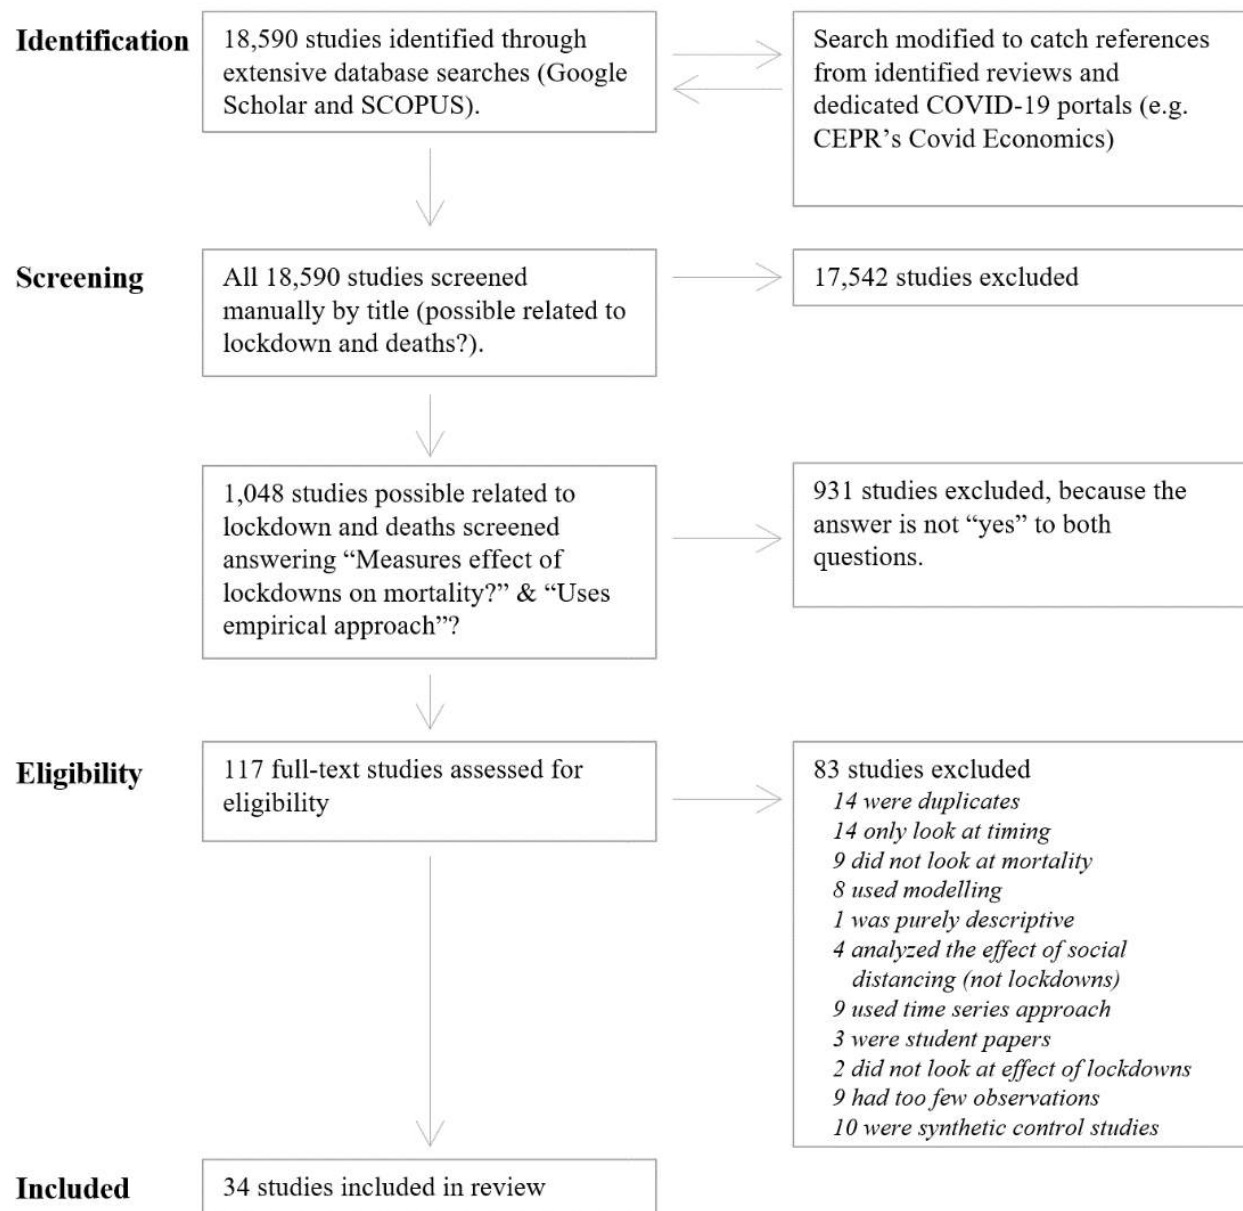

Figure 3 shows an overview of our identification process using a flow diagram designed according to PRISMA guidelines (Moher et al. (2009)). Of 18,590 studies identified during our database searches, 1,048 remained after a title-based screening. Then, 931 studies were excluded, because they either did not measure the effect of lockdowns on mortality or did not use an empirical approach. This left 117 studies that were read and inspected. After a more thorough assessment, 83 of the 117 were excluded, leaving 34 studies eligible for our meta-analysis. A table with all 83 studies excluded in the final step can be found in Appendix B, Table 8.

³ We use “mortality” and “mortality rates” interchangeably to mean COVID-19 deaths per population.

⁴ For example, we will say that Country A introduced the *non-pharmaceutical interventions* school closures and shelter-in-place-orders as part of the country’s *lockdown*.

⁵ An interesting question is, “What damage lockdowns do to the economy, personal freedom and rights, and public health in general?” Although this question is important, it requires a full cost-benefit study, which is beyond the scope of this study.

Figure 3: PRISMA flow diagram for the selection of studies.

Below we present our search strategy and eligibility criteria, which follow the PRISMA guidelines and are specified in detail in our protocol Herby et al. (2021).

2.1 Search strategy

The studies we reviewed were identified by scanning *Google Scholar* and *SCOPUS* for English-language studies. We used a wide range of search terms which are combinations of three search strings: a disease search string ("covid," "corona," "coronavirus," "sars-cov-2"), a government

response search string⁶, and a methodology search string⁷. We identified papers based on 1,360 search terms. We also required mentions of “deaths,” “death,” and/or “mortality.” The search terms were continuously updated (by adding relevant terms) to fit this criterion.⁸

We also included all papers published in *Covid Economics*. Our search was performed between July 1 and July 5, 2021 and resulted in 18,590 unique studies.⁹ All studies identified using SCOPUS and Covid Economics were also found using Google Scholar. This made us comfortable that including other sources such as VOXeu and SSRN would not change the result. Indeed, many papers found using Google Scholar were from these sources.

All 18,590 studies were first screened based on the title. Studies clearly not related to our research question were deemed irrelevant.¹⁰

After screening based on the title, 1,048 papers remained. These papers were manually screened by answering two questions:

1. Does the study measure the effect of lockdowns on mortality?
2. Does the study use an empirical *ex post* difference-in-difference approach (see eligibility criteria below)?

Studies to which we could not answer “yes” to both questions were excluded. When in doubt, we made the assessment based on reading the full paper, and in some cases, we consulted with colleagues.¹¹

After the manual screening, 117 studies were retrieved for a full, detailed review. These studies were carefully examined, and metadata and empirical results were stored in an Excel

⁶ The government response search string used was: “non-pharmaceutical,” “nonpharmaceutical,” “NPI,” “NPIs,” “lockdown,” “social distancing orders,” “statewide interventions,” “distancing interventions,” “circuit breaker,” “containment measures,” “contact restrictions,” “social distancing measures,” “public health policies,” “mobility restrictions,” “covid-19 policies,” “corona policies,” “policy measures.”

⁷ The methodology search string used was: (“fixed effects,” “panel data,” “difference-in-difference,” “diff-in-diff,” “synthetic control,” “counterfactual” , “counter factual,” “cross country,” “cross state,” “cross county,” “cross region,” “cross regional,” “cross municipality,” “country level,” “state level,” “county level,” “region level,” “regional level,” “municipality level,” “event study.”

⁸ If a potentially relevant paper from one of the 13 reviews (see eligibility criteria) did not show up in our search, we added relevant words to our search strings and ran the search again. The 13 reviews were: Allen (2021); Brodeur et al. (2021); Gupta et al. (2020); Herby (2021); Johanna et al. (2020); Nussbaumer-Streit et al. (2020); Patel et al. (2020); Perra (2020); Poeschl and Larsen (2021); Pozo-Martin et al. (2020); Rezapour et al. (2021); Robinson (2021); Zhang et al. (2021).

⁹ SCOPUS was continuously monitored between July 5th and publication using a search agent. Although the search agent returned several hits during this period, only one of them, An et al. (2021), was eligible according to our eligibility criteria. The study is not included in our review, but the conclusions are in line with our conclusions, as An et al. (2021) conclude that “The analysis shows that the mask mandate is consistently associated with lower infection rates in the short term, and its early adoption boosts the long-term efficacy. By contrast, the other five policy instruments—domestic lockdowns, international travel bans, mass gathering bans, and restaurant and school closures—show weaker efficacy.”

¹⁰ This included studies with titles such as “COVID-19 outbreak and air pollution in Iran: A panel VAR analysis” and “Dynamic Structural Impact of the COVID-19 Outbreak on the Stock Market and the Exchange Rate: A Cross-country Analysis Among BRICS Nations.”

¹¹ Professor Christian Bjørnskov of University of Aarhus was particularly helpful in this process.

spreadsheet. All studies were assessed by at least two researchers. During this process, another 64 papers were excluded because they did not meet our eligibility criteria. Furthermore, nine studies with too little jurisdictional variance (< 10 observations) were excluded,¹² and 10 synthetic control studies were excluded.¹³ A table with all 83 studies excluded in the final step can be found in Appendix B, Table 8. Below we explain why these studies are excluded.

2.2 Eligibility criteria

Focus on mortality and lockdowns

We only include studies that attempt to establish a relationship (or lack thereof) between lockdown policies and COVID-19 mortality or excess mortality. We exclude studies that use cases, hospitalizations, or other measures.¹⁴

Counterfactual difference-in-difference approach

We distinguish between two methods used to establish a relationship (or lack thereof) between mortality rates and lockdown policies. The first uses registered cross-sectional mortality data. These are *ex post* studies. The second method uses simulated data on mortality and infection rates.¹⁵ These are *ex ante* studies.

We include all studies using a counterfactual difference-in-difference approach from the former group but disregard all *ex ante* studies, as the results from these studies are determined by model assumptions and calibrations.

Our limitation to studies using a “counterfactual difference-in-difference approach” means that we exclude all studies where the counterfactual is based on forecasting (such as a SIR-model) rather than derived from a difference-in-difference approach. This excludes studies like Duchemin et al. (2020) and Matzinger and Skinner (2020). We also exclude all studies based on interrupted time series designs that simply compare the situation before and after lockdown, as

¹²The excluded studies with too few observations were: Alemán et al. (2020), Berardi et al. (2020), Conyon et al. (2020a), Coccia (2021), Gordon et al. (2020), Juranek and Zoutman (2021), Kapoor and Ravi (2020), Umer and Khan (2020), and Wu and Wu (2020).

¹³ The excluded synthetic control studies were: Conyon and Thomsen (2021), Dave et al. (2020), Ghosh et al. (2020), Born et al. (2021), Reinbold (2021), Cho (2020), Friedson et al. (2021), Neidhöfer and Neidhöfer (2020), Cerqueti et al. (2021), and Mader and Rüttenauer (2021).

¹⁴ Analyses based on cases may pose major problems, as testing strategies for COVID-19 infections vary enormously across countries (and even over time within a given country). In consequence, cross-country comparisons of cases are, at best, problematic. Although these problems exist with death tolls as well, they are far more limited. Also, while cases and death tolls are correlated, there may be adverse effects of lockdowns that are not captured by the number of cases. For example, an infected person who is isolated at home with family under a SIPO may infect family members with a higher viral load causing more severe illness. So even if a SIPO reduces the number of cases, it may theoretically increase the number of COVID-19-deaths. Adverse effects like this may explain why studies like Chernozhukov et al. (2021) finds that SIPO reduces the number of cases but have no significant effect on the number of COVID-19-deaths. Finally, mortality is hierarchically the most important outcome, cf. GRADEpro (2013)

¹⁵ These simulations are often made in variants of the SIR-model, which can simulate the progress of a pandemic in a population consisting of people in different states (Susceptible, Infectious, or Recovered) with equations describing the process between these states.

the effect of lockdowns in these studies might contain time-dependent shifts, such as seasonality. This excludes studies like Bakolis et al. (2021) and Siedner et al. (2020).

Given our criteria, we exclude the much-cited paper by Flaxman et al. (2020), which claimed that lockdowns saved three million lives in Europe. Flaxman et al. assume that the pandemic would follow an epidemiological curve unless countries locked down. However, this assumption means that the only interpretation possible for the empirical results is that lockdowns are the only thing that matters, even if other factors like season, behavior etc. caused the observed change in the reproduction rate, R_t . Flaxman et al. are aware of this and state that “our parametric form of R_t assumes that changes in R_t are an immediate response to interventions rather than gradual changes in behavior.” Flaxman et al. illustrate how problematic it is to force data to fit a certain model if you want to infer the effect of lockdowns on COVID-19 mortality.¹⁶

The counterfactual difference-in-difference studies in this review generally exploit variation across countries, U.S. states, or other geographical jurisdictions to infer the effect of lockdowns on COVID-19 fatalities. Preferably, the effect of lockdowns should be tested using randomized control trials, natural experiments, or the like. However, there are very few studies of this type.¹⁷

Synthetic control studies

The synthetic control method is a statistical method used to evaluate the effect of an intervention in comparative case studies. It involves the construction of a synthetic control which functions as the counterfactual and is constructed as an (optimal) weighted combination of a pool of donors. For example, Born et al. (2021) create a synthetic control for Sweden which consists of 30.0% Denmark, 25.3% Finland, 25.8% Netherlands, 15.0% Norway, and 3.9% Sweden. The effect of the intervention is derived by comparing the actual developments to those contained in the synthetic control.

We exclude synthetic control studies because of their inherent empirical problems as discussed by Bjørnskov (2021b). He finds that the synthetic control version of Sweden in Born et al. (2021) deviates substantially from “actual Sweden,” when looking at the period before mid-March 2020, when Sweden decided not to lock down. Bjørnskov estimates that *actual Sweden* experienced

¹⁶ Several scholars have criticized Flaxman et al. (2020), e.g. see Homburg and Kuhbandner (2020), Lewis (2020), and Lemoine (2020).

¹⁷ Kepp and Bjørnskov (2021) is one such study. They use evidence from a quasi-natural experiment in the Danish region of Northern Jutland. After the discovery of mutations of Sars-CoV-2 in mink – a major Danish export – seven of the 11 municipalities of the region went into extreme lockdown in early November, while the four other municipalities retained the moderate restrictions of the remaining country. Their analysis shows that while infection levels decreased, they did so before lockdown was in effect, and infection numbers also decreased in neighbor municipalities without mandates. They conclude that efficient infection surveillance and voluntary compliance make full lockdowns unnecessary, at least in some circumstances. Kepp and Bjørnskov (2021) is not included in our review, because they focus on cases and not COVID-19 mortality. Dave et al. (2020) is another such study. They see the Wisconsin Supreme Court abolishment of Wisconsin’s “Safer at Home” order (a SIPO) as a natural experiment and find that “the repeal of the state SIPO impacted social distancing, COVID-19 cases, or COVID-19-related mortality during the fortnight following enactment.” Dave et al. (2020) is not included in our review, because they use a synthetic control method.

approximately 500 fewer deaths the first 11 weeks of 2020 and 4,500 fewer deaths in 2019 compared to *synthetic Sweden*.

This problem is inherent in all synthetic control studies of COVID-19, Bjørnskov argues, because the synthetic control should be fitted based on a long period of time before the intervention or the event one is studying the consequences of – i.e., the lockdown Abadie (2021). However, this is not possible for the coronavirus pandemic, as there clearly *is* no long period with coronavirus before the lockdown. Hence, the synthetic control study approach is *by design* not appropriate for studying the effect of lockdowns.

Jurisdictional variance - few observations

We exclude all interrupted time series studies which simply compare mortality rates before and after lockdowns. Simply comparing data from before and after the imposition of lockdowns could be the result of time-dependent variations, such as seasonal effects. For the same reason, we also exclude studies with little jurisdictional variance.¹⁸ For example, we exclude Conyon et al. (2020b) who “exploit policy variation between Denmark and Norway on the one hand and Sweden on the other” and, thus, only have one jurisdictional area in the control group. Although this *is* a difference-in-difference approach, there is a non-negligible risk that differences are caused by much more than just differences in lockdowns. Another example is Wu and Wu (2020), who use all U.S. states, but pool groups of states so they end with basically three observations. None of the excluded studies cover more than 10 jurisdictional areas.¹⁹ One study is a special case of the jurisdictional variance criteria (Auger et al. (2020)). Those researchers analyze the effect of school closures in U.S. states and find that those closures reduce mortality by 35%. However, all 50 states closed schools between March 13, 2020, and March 23, 2020, which means that all difference-in-difference is based on maximum 10 days. Given the long lag between infection and death, there is a risk that Auger et al.’s approach is an interrupted time series analysis where they compare United States before and after school closures, rather than a true difference-in-difference approach. However, we choose to include this study, as it is eligible under our protocol Herby et al. (2021).

Publication status and date

We include all *ex post* studies regardless of publication status and date. That is, we cover both working papers and papers published in journals. We include the early papers because the knowledge of the COVID-19-pandemic grew rapidly in the beginning, making later papers able to stand on the shoulders of previous work. Also, in the early days of COVID-19, speed was

¹⁸ A jurisdictional area can be countries, U.S. states, or counties. With “jurisdictional variance” we refer to variation in mandates across jurisdictional areas.

¹⁹ All studies excluded on this criterion are listed in footnote 12.

crucial which may have affected the quality of the papers. Including them makes it possible to compare the results of early studies to studies carried out at a later stage.²⁰

The role of optimal timing

We exclude papers which analyze the effect of early lockdowns in contrast to later lockdowns. There's no doubt that being prepared for a pandemic and knowing when it arrives at your doorstep is vital. However, at least two problems arise with respect to evaluating the effect of well-timed lockdowns.

First, when COVID-19 hit Europe and the United States, it was virtually impossible to determine the right timing. The World Health Organization declared the outbreak a pandemic on March 11, 2020, but at that date, Italy had already registered 13.7 COVID-19 deaths per million. On March 29, 2020, 18 days after the WHO declared the outbreak a pandemic and the earliest a lockdown response to the WHO's announcement could potentially have an effect, the mortality rate in Italy was a staggering 178 COVID-19 deaths per million with an additional 13 per million dying each day.²¹

Secondly, it is extremely difficult to differentiate between the effect of public awareness and the effect of lockdowns when looking at timing because people and politicians are likely to react to the same information. As Figure 4 illustrates, all European countries and U.S. states that were hit hard and early by COVID-19 experienced high mortality rates, whereas all countries hit relatively late experienced low mortality rates. Björk et al. (2021) illustrate the difficulties in analyzing the effect of timing. They find that a 10-stringency-points-stricter lockdown would reduce COVID-19 mortality by a total of 200 deaths per million²² if done in week 11, 2020, but would only have approximately 1/3 of the effect if implemented one week earlier or later and no effect if implemented three weeks earlier or later. One interpretation of this result is that lockdowns do not work if people either find them unnecessary and fail to obey the mandates or if people voluntarily lock themselves down. This is the argument Allen (2021) uses for the ineffectiveness of the lockdowns he identifies. If this interpretation is true, what Björk et al. (2021) find is that information and signaling is far more important than the strictness of the lockdown. There may be other interpretations, but the point is that studies focusing on timing cannot differentiate between these interpretations. However, if lockdowns have a notable effect, we should see this effect regardless of the timing, and we should identify this effect more correctly by excluding studies that exclusively analyze timing.

²⁰ We also intended to exclude studies which were primarily based on data from 2021 (as these studies would be heavily affected by vaccines) and studies that did not cover at least one EU-country, the United States, one U.S. state or Latin America, and where at least one country/state was not an island. However, we did not find any such studies.

²¹ There's approximately a two-to-four-week gap between infection and deaths. See footnote 29.

²² They estimate that 10-point higher stringency will reduce excess mortality by 20 "per week and million" in the 10 weeks from week 14 to week 23.

Figure 4: Taken by surprise. The importance of having time to prepare

Comment: The figure shows the relationship between early pandemic strength and total 1st wave of COVID-19 death toll. On the X-axis is “Days to reach 20 COVID-19-deaths per million (measured from February 15, 2020).” The Y-axis shows mortality (deaths per million) by June 30, 2020.

Source: Reported COVID-19 deaths and OxCGRT stringency for European countries and U.S. states with more than one million citizens. Data from Our World in Data.

We are aware of one meta-analysis by Stephens et al. (2020), which looks into the importance of timing. The authors find 22 studies that look at policy and timing with respect to mortality rates, however, only four were multi-country, multi-policy studies, which could possibly account for the problems described above. Stephens et al. conclude that “the timing of policy interventions across countries relative to the first Wuhan case, first national disease case, or first national death, is not found to be correlated with mortality.” (See Appendix A for further discussion of the role of timing.)

3 The empirical evidence

In this section we present the empirical evidence found through our identification process. We describe the studies and their results, but also comment on the methodology and possible identification problems or biases.

3.1 Preliminary considerations

Before we turn to the eligible studies, we present some considerations that we adopted when interpreting the empirical evidence.

Empirical interpretation

While the policy conclusions contained in some studies are based on statistically significant results, many of these conclusions are ill-founded due to the tiny impact associated with said statistically significant results. For example, Ashraf (2020) states that “social distancing

measures has proved effective in controlling the spread of [a] highly contagious virus.” However, their estimates show that the average lockdown in Europe and the U.S only reduced COVID-19 mortality by 2.4%.²³ Another example is Chisadza et al. (2021). The authors argue that “less stringent interventions increase the number of deaths, whereas more severe responses to the pandemic can lower fatalities.” Their conclusion is based on a negative estimate for the squared term of *stringency* which results in a total negative effect on mortality rates (i.e. fewer deaths) for stringency values larger than 124. However, the stringency index is limited to values between 0 and 100 by design, so the conclusion is clearly incorrect. To avoid any such biases, we base our interpretations solely on the empirical estimates and not on the authors’ own interpretation of their results.

Handling multiple models, specifications, and uncertainties

Several studies adopt a number of models to understand the effect of lockdowns. For example, Bjørnskov (2021a) estimates the effect after one, two, three, and four weeks of lockdowns. For these studies, we select the longest time horizon analyzed to obtain the estimate closest to the long-term effect of lockdowns.

Several studies also use multiple specifications including and excluding potentially relevant variables. For these studies, we choose the model which the authors regard as their main specification. Finally, some studies have multiple models which the authors regard as equally important. One interesting example is Chernozhukov et al. (2021), who estimate two models with and without national case numbers as a variable. They show that including this variable in their model alters the results substantially. The explanation could be that people responded to national conditions. For these studies, we present both estimates in Table 1, but – following Doucouliagos and Paldam (2008) – we use an average of the estimates in our meta-analysis in order to not give more weight to a study with multiple models relative to studies with just one principal model.

For studies looking at different classes of countries (e.g. rich and poor), we report both estimates in Table 1 but use the estimate for rich Western countries in our meta-analysis, where we derive common estimates for Europe and the United States.

Effects are measured “relative to Sweden in the spring of 2020”

Virtually all countries in the world implemented mandated NPIs in response to the COVID-19 pandemic. Hence, most estimates are relative to “doing the least,” which in many Western countries means relative to doing as Sweden has done, especially during the first wave, when Sweden, do to constitutional constraints, implemented very few restrictions compared to other western countries (Jonung and Hanke 2020). However, some studies *do* compare the effect of doing something to the effect of doing absolutely nothing (e.g. Bonardi et al. (2020)).

The consequence is that some estimates are relative to “doing the least” while others are relative to “doing nothing.” This may lead to biases if “doing the least” works as a signal (or warning)

²³ We describe how we arrive at the 2.4% in Section 4.

which alters the behavior of the public. For example, Gupta et al. (2020) find a large effect of emergency declarations, which they argue “are best viewed as an information instrument that signals to the population that the public health situation is serious and they act accordingly,” on social distancing but not of other policies such as SIPOs (shelter-in-place orders). Thus, if we compare a country issuing a SIPO to a country doing nothing, we may overestimate the effect of a SIPO, because it is the sum of the signal *and* the SIPO. Instead, we should compare the country issuing the SIPO to a country “doing the least” to estimate the *marginal* effect of the SIPO.

To take an example, Bonardi et al. (2020) find relatively large effects of doing *something* but no effect of doing *more*. They find no extra effect of stricter lockdowns relative to less strict lockdowns and state that “our results point to the fact that people might adjust their behaviors quite significantly as partial measures are implemented, which might be enough to stop the spread of the virus.” Hence, whether the baseline is Sweden, which implemented a ban on large gatherings early in the pandemic, or the baseline is “doing nothing” can affect the magnitude of the estimated impacts. There is no obvious right way to resolve this issue, but since estimates in most studies are relative to doing less, we report results as compared to “doing less” when available. Hence, for Bonardi et al. we state that the effect of lockdowns is zero (compared to Sweden’s “doing the least”).

3.2 Overview of the findings of eligible studies

Table 1 covers the 34 studies eligible for our review.²⁴ Out of these 34 studies, 22 were peer-reviewed and 12 were working papers. The studies analyze lockdowns during the first wave. Most of the studies (29) use data collected before September 1st, 2020 and 10 use data collected before May 1st, 2020. Only one study uses data from 2021. All studies are cross-sectional, ranging across jurisdictions. Geographically, 14 studies cover countries worldwide, four cover European countries, 13 cover the United States, two cover Europe and the United States, and one covers regions in Italy. Seven studies analyze the effect of SIPOs, 10 analyze the effect of stricter lockdowns (measured by the OxCGRT stringency index), 16 studies analyze specific NIP’s independently, and one study analyzes other measures (length of lockdown).

Several studies find no statistically significant effect of lockdowns on mortality. For example, this includes Bjørnskov (2021a) and Stockenhuber (2020) who find no significant effect of stricter lockdowns (higher OxCGRT stringency index), Sears et al. (2020) and Dave et al. (2021), who find no significant effect of SIPOs, and Chaudhry et al. (2020), Aparicio and Grossbard (2021) and Guo et al. (2021) who find no significant effect of any of the analyzed NIP’s, including business closures, school closures and border closures.

Other studies find a significant negative relationship between lockdowns and mortality. Fowler et al. (2021) find that SIPOs reduce COVID-19 mortality by 35%, while Chernozhukov et al.

²⁴ The following information can be found for each study in Table 2.

(2021) find that employee mask mandates reduces mortality by 34% and closing businesses and bars reduces mortality by 29%.

Some studies find a significant positive relationship between lockdowns and mortality. This includes Chisadza et al. (2021), who find that stricter lockdowns (higher OxCGRT stringency index) increases COVID-19 mortality by 0.01 deaths/million per stringency point and Berry et al. (2021), who find that SIPOs increase COVID-19 mortality by 1% after 14 days.

Most studies use the number of official COVID-19 deaths as the dependent variable. Only one study, Bjørnskov (2021a), looks at total excess mortality which – although is not perfect – we perceive to be the best measure, as it overcomes the measurement problems related to properly reporting COVID-19 deaths.

Several studies explicitly claim that they estimate the actual causal relationship between lockdowns and COVID-19 mortality. Some studies use instrumental variables to justify the causality associated with their analysis, while others make causality probable using anecdotal evidence.²⁵ But, Sebhatu et al. (2020) show that government policies are strongly driven by the policies initiated in neighboring countries rather than by the severity of the pandemic in their own countries. In short, it is not the severity of the pandemic that drives the adoption of lockdowns, but rather the propensity to copy policies initiated by neighboring countries. The Sebhatu et al. conclusion throws into doubt the notion of a causal relationship between lockdowns and COVID-19 mortality.

Table 1: Summary of eligible studies

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
Alderman and Harjoto (2020); "COVID-19: U.S. shelter-in-place orders and demographic characteristics linked to cases, mortality, and recovery rates"	COVID-19 mortality	Use State-level data from the COVID-19 Tracking Project data all U.S. states, and a multivariate regression analysis to empirically investigate the impacts of the duration of shelter-in-place orders on mortality.	Find that shelter-in-place orders are - for the average duration - associated with 1% (insignificant) fewer deaths per capita.	
Aparicio and Grossbard (2021); "Are Covid Fatalities in the U.S. Higher than in the EU, and If so, Why?"	COVID-19 mortality	Their main focus is to explain the gap in COVID-19-fatalities between Europe and the United States based on COVID-deaths and other data from 85 nations/states. They include status for "social events" (ban on public gatherings, cancellation of major events and conferences), school closures, shop closures "partial lockdowns" (e.g. night curfew) and "lockdowns" (all-day curfew) 100 days after the pandemic onset in a country/state. None of these interventions have a significant effect on COVID-19 mortality. They also find no	Find no effect of "social events" (ban on public gatherings, cancellation of major events and conferences), school closures, shop closures "partial lockdowns" (e.g. night curfew) and "lockdowns" (all-day curfew) 100 days after the pandemic onset.	In the abstract the authors states that "various types of social distance measures such as school closings and lockdowns, and how soon they were implemented, help explain the U.S./EUROPE gap in cumulative deaths measured 100 days after the pandemic's onset in a state or country" although their estimates are insignificant.

²⁵ E.g. Dave et al. (2021) states that "estimated case reductions accelerate over time, becoming largest after 20 days following enactment of a SIPO. These findings are consistent with a causal interpretation."

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
		significant effect of early cancelling of social events, school closures, shop closures, partial lockdowns and full lockdowns.		
Ashraf (2020); "Socioeconomic conditions, government interventions and health outcomes during COVID-19"	COVID-19 mortality	Their main focus is on the effectiveness of policies targeted to diminish the effect of socioeconomic inequalities (economic support) on COVID-19-deaths. They use data from 80 countries worldwide and include the OxCGRT stringency as a control variable in their models. The paper finds a significant negative (fewer deaths) effect of stricter lockdowns. The effect of lockdowns is insignificant, when they include an interaction term between the socioeconomic conditions index and the economic support index in their model.	For each 1-unit increase in OxCGRT stringency index, the cumulative mortality changes by -0.326 deaths per million (fewer deaths). The estimate is -0.073 deaths per million but insignificant, when including an interaction term between the socioeconomic conditions index and the economic support index.	
Auger et al. (2020); "Association between statewide school closure and COVID-19 incidence and mortality in the U.S."	COVID-19 mortality	U.S. population-based observational study which uses interrupted time series analyses incorporating a lag period to allow for potential policy-associated changes to occur. To isolate the association of school closure with outcomes, state-level nonpharmaceutical interventions and attributes were included in negative binomial regression models. Models were used to derive the estimated absolute differences between schools that closed and schools that remained open. The main outcome of the study is COVID-19 daily incidence and mortality per 100000 residents.	State that they adjust for several factors (e.g percentage of state's population aged 15 years and 65 years, CDC's social vulnerability index, stay-at-home or shelter-in-place order, restaurant and bar closure, testing rate per 1000 residents etc.), but does not specify how and do not present estimates.	All 50 states closed schools between March 13, 2020, and March 23, 2020. Hence, all difference-in-difference is based on maximum 10 days, and given the long lag between infection and death, there is a risk that their approach is more an interrupted time series analysis, where they compare United States before and after school closures, rather than a true difference-in-difference approach. However, we choose to include the study in our review as it - objectively speaking - lives up to the eligibility criteria specified in our protocol.
Berry et al. (2021); "Evaluating the effects of shelter-in-place policies during the COVID-19 pandemic"	COVID-19 mortality	The authors use U.S. county data on COVID-19 deaths from Johns Hopkin and SIPO data from the University of Washington to estimate the effect of SIPO's. They find no detectable effects of SIPO on deaths. The authors stress that their findings should not be interpreted as evidence that social distancing behaviors are not effective. Many people had already changed their behaviors before the introduction of shelter-in-place orders, and shelter-in-place orders appear to have been ineffective precisely because they did not meaningfully alter social distancing behavior.	SIPO increases the number of deaths by 0,654 per million after 14 days (see Fig. 2)	The authors conclude that "We do not find detectable effects of these policies [SIPO] on disease spread or deaths." However, this statement does not correspond to their results. In figure 2 they show that the effect on deaths is significant after 14 days. Looks at the effect 14 days after SIPO's are implemented which is a short lag given that the time between infection and deaths is at least 2-3 weeks.
Bjørnskov (2021a); "Did Lockdown Work? An Economist's Cross-Country Comparison"	Excess mortality	Uses excess mortality and OxCGRT stringency from 24 European countries to estimate the effect of lockdown on the number of deaths one, two, three and four weeks later. Finds no effect (negative but insignificant) of (stricter) lockdowns. The author's specification using instrument variables yields similar results.	A stricter lockdown (OxCGRT stringency) does not have a significant effect on excess mortality.	Finds a positive (more deaths) effect after one and two weeks, which could indicate that other factors (omitted variables) affect the results.
Blanco et al. (2020); "Do Coronavirus Containment Measures Work? Worldwide Evidence"	COVID-19 mortality	Use data for deaths and NPIs from Hale et al. (2020) covering 158 countries between January and August 2020 to evaluate the effect of eight different NPIs (stay at home, bans on gatherings, bans on public	When using the naïve dummy variable approach, all parameters are statistically	Run the same model four times for each of the different NPIs (stay at home-orders, ban on meetings, ban on public events and mobility restrictions). These NPIs were often introduced almost simultaneously so there is a high risk of

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
		events, closing schools, lockdowns of workplaces, interruption of public transportation services, and international border closures. They address the possible endogeneity of the NPIs by using instrumental variables.	insignificant. On the contrary, estimates using the instrumental variable approach indicate that NPIs are effective in reducing the growth rate in the daily number of deaths 14 days later.	multicollinearity with each run capturing the same underlying effect. Indeed, the size and standard errors of the estimates are worryingly similar. Looks at the effect 14 days after NPIs are implemented which is a fairly short lag given the time between infection and deaths is 2-3 weeks, cf. e.g. Flaxman et al. (2020), which according to Bjørnskov (2020) appears to be the minimum typical time from infection to death).
Bonardi et al. (2020); "Fast and local: How did lockdown policies affect the spread and severity of the covid-19"	Growth rates	Use NPI data scraped from news headlines from LexisNexis and death data from Johns Hopkins University up to April 1st 2020 in a panel structure with 184 countries. Controls for country fixed effects, day fixed effects and within-country evolution of the disease.	Find that certain interventions (SIPO, regional lockdown and partial lockdown) work (in developed countries), but that stricter interventions (SIPO) do not have a larger effect than less strict interventions (e.g. restrictions on gatherings). Find no effect of border closures.	Find a positive (more deaths) effect on day 1 after lockdown which may indicate that their results are driven by other factors (omitted variables). We rely on their publicly available version submitted to CEPR Covid Economics, but estimates on the effect of deaths can be found in Supplementary material, which is available in an updated version hosted on the Danish Broadcasting Corporation's webpage: https://www.dr.dk/static/documents/2021/03/04/managing_pandemics_e3911c11.pdf
Bongaerts et al. (2021); "Closed for business: The mortality impact of business closures during the Covid-19 pandemic"	COVID-19 mortality	Uses variation in exposure to closed sectors (e.g. tourism) in municipalities within Italy to estimate the effect of business closures. Assuming that municipalities with different exposures to closed sectors are not inherently different, they find that municipalities with higher exposure to closed sectors experienced subsequently lower mortality rates.	Business shutdown saved 9,439 Italian lives by April 13th 2020. This corresponds to a reduction of deaths by 32%, as there were 20,465 COVID-19-deaths in Italy by mid April 2020.	They (implicitly) assume that municipalities with different exposures to closed sectors are not inherently different. This assumption could be problematic, as more touristed municipalities can be very different from e.g. more industrialized municipalities.
Chaudhry et al. (2020); "A country level analysis measuring the impact of government actions, country preparedness and socioeconomic factors on COVID-19 mortality and related health outcomes"	COVID-19 mortality	Uses information on COVID-19 related national policies and health outcomes from the top 50 countries ranked by number of cases. Finds no significant effect of any NPI on the number of COVID-19-deaths.	Finds no significant effect on mortality of any of the analyzed interventions (partial border closure, complete border closure, partial lockdown (physical distancing measures only), complete lockdown (enhanced containment measures including suspension of all non-essential services), and curfews).	
Chernozhukov et al. (2021); "Causal impact of masks, policies, behavior on early covid-19 pandemic in the U.S."	Growth rates	Uses COVID-deaths from the New York Times and Johns Hopkins and data for U.S. States from Raifman et al. (2020) to estimate the effect of SIPO, closed nonessential businesses, closed K-12 schools, closed restaurants except takeout, closed movie theaters, and face mask mandates for employees in public facing businesses.	Finds that mandatory masks for employees and closing K-12 schools reduces deaths. SIPO and closing business (average of closed businesses, restaurants and movie theaters) has no statistically significant effect. The effect of school closures is highly sensitive to the	States that "our regression specification for case and death growths is explicitly guided by a SIR model although our causal approach does not hinge on the validity of a SIR model." We are uncertain if this means that data are managed to fit an SIR-model (and thus should fail our eligibility criteria).

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
			inclusion of national case and death data.	
Chisadza et al. (2021); "Government Effectiveness and the COVID-19 Pandemic"	COVID-19 mortality	Uses COVID-19-deaths and OxCGRT stringency from 144 countries to estimate the effect of lockdown on the number of COVID-19-deaths. Find a significant positive (more deaths) non-linear association between government response indices and the number of deaths.	An increase by 1 on "stringency index" increases the number of deaths by 0.0130 per million. The sign of the squared term is negative, but the combined non-linear estimate is positive (increases deaths) and larger than the linear estimate for all values of the OxCGRT stringency index.	The author states that "less stringent interventions increase the number of deaths, whereas more severe responses to the pandemic can lower fatalities." However, according to their estimates this is not correct, as the combined non-linear estimate cannot be negative for relevant values of the OxCGRT stringency index (0 to 100).
Dave et al. (2021); "When Do Shelter-in-Place Orders Fight Covid-19 Best? Policy Heterogeneity Across States and Adoption Time"	COVID-19 mortality	Uses smartphone location tracking and state data on COVID-19 deaths and SIPO data (supplemented by their own searches) collected by the New York Times to estimate the effect of SIPO's. Finds that SIPO was associated with a 9%-10% increase in the rate at which state residents remained in their homes full-time, but overall they do not find a significant effect on mortality after 20+ days (see Figure 4). Indicate that the lacking significance may be due to long term estimates being identified of a few early adopting states.	Finds no overall significant effect of SIPO on deaths but does find a negative effect (fewer deaths) in early adopting states.	Find large effects of SIPO on deaths after 6-14 days in early adopting states (see Table 8), which is before an SIPO-related effect would be seen. This could indicate that other factors rather than SIPO's drive the results.
Dergiades et al. (2020); "Effectiveness of government policies in response to the COVID-19 outbreak"	COVID-19 mortality	Uses daily deaths from the European Centre for Disease Prevention and Control and OxCGRT stringency from 32 countries worldwide (including U.S.) to estimate the effect of lockdown on the number of deaths.	Finds that the greater the strength of government interventions at an early stage, the more effective these are in slowing down or reversing the growth rate of deaths.	Focus is on the effect of early stage NPIs and thus does not absolutely live up to our eligibility criteria. However, we include the study as it differentiates between lockdown strength at an early stage.
Fakir and Bharati (2021); "Pandemic catch-22: The role of mobility restrictions and institutional inequalities in halting the spread of COVID-19"	COVID-19 mortality	Uses data from 127 countries, combining high-frequency measures of mobility data from Google's daily mobility reports, country-date-level information on the stringency of restrictions in response to the pandemic from Oxford's Coronavirus Government Response Tracker (OxCGRT), and daily data on deaths attributed to COVID-19 from Our World In Data and the Johns Hopkins University. Instrument stringency using day-to-day changes in the stringency of the restrictions in the rest of the world.	Find large causal effects of stricter restrictions on the weekly growth rate of recorded deaths attributed to COVID-19. Show that more stringent interventions help more in richer, more educated, more democratic, and less corrupt countries with older, healthier populations and more effective governments.	Finds a larger effect on deaths after 0 days than after 14 and 21 days (Table 3). This is surprising given that it takes 2-3 weeks from infection to death, and it may indicate that their results are driven by other factors.
Fowler et al. (2021); "Stay-at-home orders associate with subsequent decreases in COVID-19 cases and fatalities in the United States"	COVID-19 mortality	Uses U.S. county data on COVID-19 deaths and SIPO data collected by the New York Times to estimate the effect of SIPO's using a two-way fixed-effects difference-in-differences model. Find a large and early (after few days) effect of SIPO on COVID-19 related deaths.	Stay-at-home orders are also associated with a 59.8 percent (18.3 to 80.2) average reduction in weekly fatalities after three weeks. These results suggest that stay-at-home orders	Finds the largest effect of SIPO on deaths after 10 days (see Figure 4), before a SIPO-related effect could possibly be seen as it takes 2-3 weeks from infection to death. This could indicate that other factors drive their results.

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
			might have reduced confirmed cases by 390,000 (170,000 to 680,000) and fatalities by 41,000 (27,000 to 59,000) within the first three weeks in localities that implemented stay-at-home orders.	
Fuller et al. (2021); "Mitigation Policies and COVID-19-Associated Mortality – 37 European Countries, January 23–June 30, 2020"	COVID-19 mortality	Uses COVID-19-deaths and OxCGRT stringency in 37 European countries to estimate the effect of lockdown on the number of COVID-19-deaths. Find a significant negative (fewer deaths) effect of stricter lockdowns after mortality threshold is reached (the threshold is a daily rate of 0.02 new COVID-19 deaths per 100,000 population (based on a 7-day moving average))	For each 1-unit increase in OxCGRT stringency index, the cumulative mortality decreases by 0.55 deaths per 100,000.	
Gibson (2020); "Government mandated lockdowns do not reduce Covid-19 deaths: implications for evaluating the stringent New Zealand response"	COVID-19 mortality	Uses data for every county in the United States from March through June 1, 2020, to estimate the effect of SIPO (called "lockdown") on COVID-19 mortality. Policy data are acquired from American Red Cross reporting on emergency regulations. His control variables include county population and density, the elder share, the share in nursing homes, nine other demographic and economic characteristics and a set of regional fixed effects. Handles causality problems using instrument variables (IV).	Find no statistically significant effect of SIPO.	Gibson use the word "lockdown" as synonym for SIPO (writes "technically, government-ordered community quarantine")
Goldstein et al. (2021); "Lockdown Fatigue: The Diminishing Effects of Quarantines on the Spread of COVID-19 "	COVID-19 mortality	Uses panel data from 152 countries with data from the onset of the pandemic until December 31, 2020. Finds that lockdowns tend to reduce the number of COVID-19 related deaths, but also that this benign impact declines over time: after four months of strict lockdown, NPIs have a significantly weaker contribution in terms of their effect in reducing COVID-19 related fatalities.	Stricter lockdowns reduce deaths for the first 60 days, whereafter the cumulative effect begins to decrease. If reintroduced after 120, the effect of lockdowns is smaller in the short run, but after 90 days the effect is almost the same as during first lockdown (only app. 10% lower).	There is little documentation in the study (e.g. no tables with estimates).
Guo et al. (2021); "Mitigation Interventions in the United States: An Exploratory Investigation of Determinants and Impacts"	COVID-19 mortality	Uses policy data from 1,470 executive orders from the state-government websites for all 50 states and Washington DC and COVID-19-deaths from Johns Hopkins University in a random-effect spatial error panel model to estimate the effect of nine NPIs (SIPO, strengthened SIPO, public school closure, all school closure, large-gathering ban of more than 10 people, any gathering ban, restaurant/bar limit to dining out only, nonessential business closure, and mandatory self-quarantine of travelers) on COVID-19 deaths.	Two mitigation strategies (all school closure and mandatory self-quarantine of travelers) showed positive (more deaths) impact on COVID-19-deaths per 10,000. Six mitigation strategies (SIPO, public school closure, large gathering bans (>10), any gathering ban, restaurant/bar limit to dining out only, and nonessential business	Only conclude on NPIs which reduce mortality. However, the conclusion is based on one-tailed tests, which means that all positive estimates (more deaths) are deemed insignificant. Thus, in their mortality-specification (Table 3, Proportion of Cumulative Deaths Over the Population), the estimate of all school closures (.204) and mandatory self-quarantine of travelers (0.363) is deemed insignificant based on schools CI [.029, .379] and quarantine CI [.193, .532]. We believe, these results should be interpreted as a significant increase in mortality, and that these results should have been part of their conclusion.

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
			closure) did not show any impact (Table 3, "Proportion of Cumulative Deaths Over the Population).	
Hale et al. (2020); "Global assessment of the relationship between government response measures and COVID-19 deaths"	COVID-19 mortality	Uses the OxCGRT stringency and COVID-19-deaths from the European Centre for Disease Prevention and Control for 170 countries. Estimates both cross-sectional models in which countries are the unit of analysis, as well as longitudinal models on time-series panel data with country-day as the unit of analysis (including models that use both time and country fixed effects).	Finds that higher stringency in the past leads to a lower growth rate in the present, with each additional point of stringency corresponding to a 0.039%-point reduction in daily deaths growth rates six weeks later.	
Hunter et al. (2021); "Impact of non-pharmaceutical interventions against COVID-19 in Europe: A quasi-experimental non-equivalent group and time-series"	COVID-19 mortality	Uses death data from the European Centre for Disease Prevention and Control (ECDC) and NPI-data from the Institute of Health Metrics and Evaluation. Argues that they use a quasi-experimental approach to identify the effect of NPIs because no analyzed intervention was imposed by all European countries and interventions were put in place at different points in the development of the epidemics.	Finds that mass gathering restrictions and initial business closures (businesses such as entertainment venues, bars and restaurants) reduces the number of deaths, whereas closing educational facilities and issuing SIPO increases the number of deaths. Finds no effect of closing non-essential services and mandating/recommending masks (Table 3)	Finds an effect of closing educational facilities and non-essential services after 1-7 days before lockdown could possibly have an effect on the number of deaths. This may indicate that other factors are driving their results.
Langeland et al. (2021); "The Effect of State Level COVID-19 Stay-at-Home Orders on Death Rates"	COVID-19 mortality	Estimates the effect of state-level lockdowns on COVID-19 deaths using multiple quasi-Poisson regressions with lockdown time length as the explanatory variable. Does not specify how lockdown is defined and what their data sources are.	Finds no significant effect of SIPO on the number of deaths after 2-4, 4-6 and 6+ weeks.	They write that "6+ weeks of lockdown is the only setting where the odds of dying are statistically higher than in the no lockdown case." However, all estimates are insignificant in Table C. Looks as if lockdown duration may cause a causality problem, because politicians may be less likely to ease restrictions when there are many cases/deaths.
Leffler et al. (2020); "Association of country-wide coronavirus mortality with demographics, testing, lockdowns, and public wearing of masks"	COVID-19 mortality	Use COVID-19 deaths from Worldometer and info about NPIs (mask/mask recommendations, international travel restrictions and lockdowns (defined as any closure of schools or workplaces, limits on public gatherings or internal movement, or stay-at-home orders) from Hale et al. (2020) for 200 countries to estimate the effect of the duration of NPIs on the number of deaths.	Finds that masking (mask recommendations) reduces mortality. For each week that masks were recommended the increase in per-capita mortality was 8.1% (compared to 55.7% increase when masks were not recommended). Finds no significant effect of the number of weeks with internal lockdowns and international travel restrictions (Table 2).	Their "mask recommendation" category includes some countries, where masks were mandated (see Supplemental Table A1) and may (partially) capture the effect of mask mandates. Looks at duration which may cause a causality problem, because politicians may be less likely to ease restrictions when there are many cases/deaths.
Mccafferty and Ashley (2021); "Covid-19 Social Distancing Interventions by Statutory Mandate and Their Observational	Other	Use data from 27 U.S. states and 12 European countries to analyze the effect of NPIs on peak mortality rate using general linear mixed effects modelling.	Finds that no mandate (school closures, prohibition on mass gatherings, business closures, stay at home	

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
Correlation to Mortality in the United States and Europe"			orders, severe travel restrictions, and closure of non-essential businesses) was effective in reducing the peak COVID-19 mortality rate.	
Pan et al. (2020); "Covid-19: Effectiveness of non-pharmaceutical interventions in the united states before phased removal of social distancing protections varies by region"	COVID-19 mortality	Uses county-level data for all U.S. states. Mortality is obtained from Johns Hopkins, while policy data are obtained from official governmental websites. Categorizes 12 policies into 4 levels of disease control; Level 1 (low) - State of Emergency; Level 2 (moderate) - school closures, restricting access (visits) to nursing homes, or closing restaurants and bars; Level 3 (high) - non-essential business closures, suspending non-violent arrests, suspending elective medical procedures, suspending evictions, or restricting mass gatherings of at least 10 people; and Level 4 (aggressive) - sheltering in place / stay-at-home, public mask requirements, or travel restrictions. Use stepped-wedge cluster randomized trial (SW-CRT) for clustering and negative binomial mixed model regression.	Concludes that only (duration of, see comment in next column) level 4 restrictions are associated with reduced risk of death, with an average 15% decline in the COVID-19 death rate per day. Implementation of level 3 and level 2 restrictions increased death rates in 6 of 6 regions, while longer duration increased death rates in 5 of 6 regions.	They focus on the negative estimate of duration of Level 4. However, their implementation estimate is large and positive, and the combined effect of implementation and duration is unclear.
Pincombe et al. (2021); "The effectiveness of national-level containment and closure policies across income levels during the COVID-19 pandemic: an analysis of 113 countries"	COVID-19 mortality	Uses daily data for 113 countries on cumulative COVID-19 death counts over 130 days between February 15, 2020, and June 23, 2020, to examine changes in mortality growth rates across the World Bank's income group classifications following shelter-in-place recommendations or orders (they use one variable covering both recommendations and orders).	Finds that shelter-in-place recommendations/orders reduces mortality growth rates in high income countries (although insignificant) but increases growth rates in countries in other income groups.	
Sears et al. (2020); "Are we #stayinghome to Flatten the Curve?"	COVID-19 mortality	Uses cellular location data from all 50 states and the District of Columbia to investigate mobility patterns during the pandemic across states and time. Adding COVID-19 death tolls and the timing of SIPO for each state they estimate the effect of stay-at-home policies on COVID-19 mortality.	Find that SIPOs lower deaths by 0.13- 0.17 per 100,000 residents, equivalent to death rates 29-35% lower than in the absence of policies. However, these estimates are insignificant at a 95% confidence interval (see Table 4). The study also finds reductions in activity levels prior to mandates. Human encounter rate fell by 63 percentage points and nonessential visits by 39 percentage points relative to pre-COVID-19 levels, prior to any state implementing a statewide mandate	In the abstract the authors state that death rates would be 42-54% lower than in the absence of policies. However, this includes averted deaths due to pre-mandate social distancing behavior (p. 6). The effect of SIPO is a reduction in deaths by 29%-35% compared to a situation without SIPO but with pre-mandate social distancing. These estimates are insignificant at a 95% confidence interval.

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
Shiva and Molana (2021); "The Luxury of Lockdown"	COVID-19 mortality	Uses COVID-19-deaths and OxCGRT stringency from 169 countries to estimate the effect of lockdown on the number of deaths 1-8 weeks later. Finds that stricter lockdowns reduce COVID-19-deaths 4 weeks later (but insignificant 8 weeks later) and have the greatest effect in high income countries. Finds no effect of workplace closures in low-income countries.	A stricter lockdown (1 stringency point) reduces deaths by 0,1% after 4 weeks. After 8 weeks the effect is insignificant.	
Spiegel and Tookes (2021); "Business restrictions and Covid-19 fatalities"	COVID-19 mortality	Use data for every county in the United States from March through December 2020 to estimate the effect of various NPIs on the COVID-19-deaths growth rate. Derives causality by 1) assuming that state regulators primarily focus on the state's most populous counties, so state regulation in smaller counties can be viewed as a quasi randomized experiment, and 2) conducting county pair analysis, where similar counties in different states (and subject to different state policies) are compared.	Finds that some interventions (e.g. mask mandates, restaurant and bar closures, gym closures, and high-risk business closures) reduces mortality growth, while other interventions (closures of low- to medium-risk businesses and personal care/spa services) did not have an effect and may even have increased the number of deaths.	In total they analyze the lockdown effect of 21 variables. 14 of 21 estimates are significant, and of these 6 are negative (reduces deaths) while 8 are positive (increases deaths). Some results are far from intuitive. E.g. mask recommendations increases deaths by 48% while mask mandates reduces deaths by 12%, and closing restaurants and bars reduces deaths by 50%, while closing bars but not restaurants only reduces deaths by 5%.
Stockenhuber (2020); "Did We Respond Quickly Enough? How Policy-Implementation Speed in Response to COVID-19 Affects the Number of Fatal Cases in Europe"	COVID-19 mortality	Uses data for the number of COVID-19 infections and deaths and policy information for 24 countries from OxCGRT to estimate the effect of stricter lockdowns on the number of deaths using principal component analysis and a generalized linear mixed model.	Finds no significant effect of stricter lockdowns on the number of fatalities (Table 4).	Groups data on lockdown strictness into four groups and lose significant information and variation.
Stokes et al. (2020); "The relative effects of non-pharmaceutical interventions on early Covid-19 mortality: natural experiment in 130 countries"	COVID-19 mortality	Uses daily Covid-19 deaths for 130 countries from the European Centre for Disease Prevention and Control (ECDC) and daily policy data from the Oxford COVID-19 Government Response Tracker (OxCGRT). Looks at all levels of restrictions for each of the nine sub-categories of the OxCGRT stringency index (school, work, events, gatherings, transport, SIPO, internal movement, travel).	Of the nine sub-categories in the OxCGRT stringency index, only travel restrictions are consistently significant (with level 2 "Quarantine arrivals from high-risk regions" having the largest effect, and the strictest level 4 "Total border closure" having the smallest effect). Restrictions on very large gatherings (>1,000) has a large significant negative (fewer deaths) effect, while the effect of stricter restrictions on gatherings are insignificant. Authors recommend that the closing of schools (level 1) has a very large (in absolute terms it's twice the effect of border quarantines) positive	Their results are counter intuitive and somewhat inconclusive. Why does limiting very large gatherings (>1,000) work, while stricter limits do not? Why do recommending school closures cause more deaths? Why is the effect of border closures before 1st death insignificant, while the effect of closing borders after 1st death is significant (and large)? And why does quarantining arrivals from high-risk regions work better than total border closures? With 23 estimated parameters in total these counter intuitive and inconclusive results could be caused by multiple test bias (we correct for this in the meta-analysis), but may also be caused by other factors such as omitted variable bias.

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
			effect (more deaths) while stricter interventions on schools have no significant effect. Required cancelling of public events also has a significant positive (more deaths) effect. We focus on their 14-38 days results, as they catch the longest time frame (their 0-24 day model returns mostly insignificant results).	
Toya and Skidmore (2020); "A Cross-Country Analysis of the Determinants of Covid-19 Fatalities"	COVID-19 mortality	Uses COVID-19-deaths and lockdown info from various sources from 159 countries in a cross-country event study. Controls for country specifics by including socio-economic, political, geographic, and policy information. Finds little evidence for the efficacy of NPIs.	Complete travel restrictions prior to April 2020 reduced deaths by -0.226 per 100,000 by April 1st 2021, while mandatory national lockdown prior to April 2020 increased deaths by 0.166 by April 1st 2021. Recommended local lockdowns reduced deaths but results are based on one observation. Partial travel restrictions, mandatory local lockdowns and recommended national lockdowns did not have a significant effect on deaths.	The study looks at the lockdown status prior to April 2020 and the effect on deaths the following year (until April 1st 2021). The authors state this is to reduce concerns about endogeneity but do not explain why the lockdowns in the spring of 2020 are a good instrument for lockdowns during later waves are.
Tsai et al. (2021); "Coronavirus Disease 2019 (COVID-19) Transmission in the United States Before Versus After Relaxation of Statewide Social Distancing Measures"	Reproduction rate, Rt	Uses data for NPIs that were implemented and/or relaxed in U.S. states between 10 March and 15 July 2020. Using segmented linear regression, they estimate the extent to which relaxation of social distancing affected epidemic control, as indicated by the time-varying, state-specific effective reproduction number (Rt). Rt is based on death tolls.	Finds that in the 8 weeks prior to relaxing NPIs, Rt was declining, while after relaxation Rt started to increase.	Their Figure 1 shows that Rt on average increases app. 10 days before relaxation, which could indicate that other factors (omitted variables) affect the results.

Note: All comments on the significance of estimates are based on a 5% significance level unless otherwise stated.

It is difficult to make a conclusion based on the overview in Table 1. Is -0.073 to -0.326 deaths/million per stringency point, as estimated by Ashraf (2020), a large or a small effect relative to. the 98% reduction in mortality predicted by the study published by the Imperial College London (Ferguson et al. (2020)). This is the subject for our meta-analysis in the next section. Here, it turns out that -0.073 to -0.326 deaths/million per stringency point is a relatively modest effect and only corresponds to a 2.4% reduction in COVID-19 mortality on average in the U.S. and Europe.

4 Meta-analysis: The impact of lockdowns on COVID-19 mortality

We now turn to the meta-analysis, where we focus on the impact of lockdowns on COVID-19 mortality.

In the meta-analysis, we include 24 studies in which we can derive the relative effect of lockdowns on COVID-19 mortality, where mortality is measured as COVID-19-related deaths per million. In practice, this means that the studies we included estimate the effect of lockdowns on mortality or the effect of lockdowns on mortality growth rates, while using a counterfactual estimate.²⁶

Our focus is on the effect of compulsory non-pharmaceutical interventions (NPI), policies that restrict internal movement, close schools and businesses, and ban international travel, among others. We do not look at the effect of voluntary behavioral changes (e.g. voluntary mask wearing), the effect of recommendations (e.g. recommended mask wearing), or governmental services (voluntary mass testing and public information campaigns), but only on mandated NPIs.

The studies we examine are placed in three categories. Seven studies analyze the effect of stricter lockdowns based on the OxCGRT stringency indices, 13 studies analyze the effect of SIPOs (6 studies only analyze SIPOs, while seven analyze SIPOs among other interventions), and 11 studies analyze the effect of specific NPIs independently (lockdown vs. no lockdown).²⁷ Each of these categories is handled so that comparable estimates can be made across categories. Below, we present the results for each category and show the overall results, as well as those based on various quality dimensions.

Quality dimensions

We include quality dimensions because there are reasons to believe that can affect a study's conclusion. Below we describe the dimensions, as well as our reasons to believe that they are necessary to fully understand the empirical evidence.

- *Peer-reviewed vs. working papers:* We distinguish between peer-reviewed studies and working papers as we consider peer-reviewed studies generally being of higher quality than working papers.²⁸
- *Long vs. short time period:* We distinguish between studies based on long time periods (with data series ending *after* May 31, 2020) and short time periods (data series ending at or before May 31, 2020), because the first wave did not fully end before late June in the U.S. and Europe. Thus, studies relying on short data periods lack the last part of the first wave and may yield biased results if lockdowns only “flatten the curve” and do not prevent deaths.

²⁶ As a minimum requirement, one needs to know the effect on the top of the curve.

²⁷ The total is larger than 21 because the 11 SIPO studies include seven studies which look at multiple measures.

²⁸ Vetted papers from CEPR Covid Economics are considered as working papers in this regard.

- *No early effect on mortality*: On average, it takes approximately three weeks from infection to death.²⁹ However, several studies find effects of lockdown on mortality almost immediately. Fowler et al. (2021) find a significant effect of SIPOs on mortality after just four days and the largest effect after 10 days. An early effect may indicate that other factors (omitted variables) drive the results, and, thus, we distinguish between studies which find an effect on mortality sooner than 14 days after lockdown and those that do not.³⁰ Note that many studies do not look at the short term and thus fall into the latter category by default.
- *Social sciences vs. other sciences*: While it is true that epidemiologists and researchers in natural sciences should, in principle, know much more about COVID-19 and how it spreads than social scientists, social scientists are, in principle, experts in evaluating the effect of various policy interventions. Thus, we distinguish between studies published by scholars in social sciences and by scholars from other fields of research. We perceive the former as being better suited for examining the effects of lockdowns on mortality. For each study, we have registered the research field for the corresponding author's associated institute (e.g., for a scholar from "Institute of economics" research field is registered as "Economics"). Where no corresponding author was available, the first author has been used. Afterwards, all research fields have been classified as either from the "Social Science" or "Other."³¹

We also considered including a quality dimension to distinguish between studies based on excess mortality and studies based on COVID-19 mortality, as we believe that excess mortality is potentially a better measure for two reasons. First, data on total deaths in a country is far more precise than data on COVID-19 related deaths, which may be both underreported (due to lack of tests) or overreported (because some people die *with* – but not *because of* – COVID-19). Secondly, a major purpose of lockdowns is to save lives. To the extent lockdowns shift deaths *from* COVID-19 *to* other causes (e.g. suicide), estimates based on COVID-19 mortality will overestimate the effect of lockdowns. Likewise, if lockdowns save lives in other ways (e.g. fewer traffic accidents) lockdowns' effect on mortality will be underestimated. However, as only one

²⁹ Leffler et al. (2020) writes, "On average, the time from infection with the coronavirus to onset of symptoms is 5.1 days, and the time from symptom onset to death is on average 17.8 days. Therefore, the time from infection to death is expected to be 23 days." Meanwhile, Stokes et al. (2020) writes that "evidence suggests a mean lag between virus transmission and symptom onset of 6 days, and a further mean lag of 18 days between onset of symptoms and death."

³⁰ Some of the authors are aware of this problem. E.g. Bjørnskov (2021a) writes "when the lag length extends to three or four weeks, that is, the length that is reasonable from the perspective of the virology of Sars-CoV-2, the estimates become very small and insignificant" and "these results confirm the overall pattern by being negative and significant when lagged one or two weeks (the period when they cannot have worked) but turning positive and insignificant when lagged four weeks."

³¹ Research fields classified as social sciences were economics, public health, management, political science, government, international development, and public policy, while research fields not classified as social sciences were ophthalmology, environment, medicine, evolutionary biology and environment, human toxicology, epidemiology, and anesthesiology.

of the 34 studies (Bjørnskov (2021a)) is based on excess mortality, we are unfortunately forced to disregard this quality dimension.

Meta-data used for our quality dimensions as well as other relevant information are shown in Table 2.

Table 2: Metadata for the studies included in the meta-analysis

Interpreting and weighting estimates

The estimates used in the meta-analysis are not always readily available in the studies shown in Table 2. In Appendix B Table 9, we describe for each paper how we interpret the estimates and how they are converted to a common estimate (the relative effect of lockdowns on COVID-19 mortality) which is comparable across all studies.

Following Paldam (2015) and Stanley and Doucouliagos (2010), we also convert standard errors³² and use the precision of each estimate (defined as $1/SE$) to calculate the precision-weighted average of all estimates and present funnel plots. The precision-weighted average is our primary indicator of the efficacy of lockdowns, but we also report arithmetic averages and medians in the meta-analysis.

In the following sections, we present the meta-analysis for each of the three groups of studies (stringency index-studies, SIPO-studies, and studies analyzing specific NPIs).

4.1 Stringency index studies

Seven eligible studies examine the link between lockdown stringency and COVID-19 mortality. The results from these studies, converted to common estimates, are presented in Table 3 below. All studies are based on the COVID-19 Government Response Tracker's (OxCGRT) stringency index of Oxford University's Blavatnik School of Government (Hale et al. (2020)).

The OxCGRT stringency index neither measures the expected effectiveness of the lockdowns nor the expected costs. Instead, it describes the stringency based on nine equally weighted parameters.³³ Many countries followed similar patterns and almost all countries closed schools,

³² Standard errors are converted such that the t-value, calculated based on common estimates and standard errors, is unchanged. When confidence intervals are reported rather than standard errors, we calculate standard errors using t-distribution with ∞ degrees of freedom (i.e. 1.96 for 95% confidence interval).

³³ The nine parameters are "C1 School closing," "C2 Workplace closing," "C3 Cancel public events," "C4 Restrictions on gatherings," "C5 Close public transport," "C6 Stay at home requirements," "C7 Restrictions on internal movement," "C8 International travel controls" and "H1 Public information campaigns." The latter, "H1

while only a few countries issued SIPOs without closing businesses. Hence, it is reasonable to perceive the stringency index as continuous, although not necessarily linear. The index includes recommendations (e.g. “workplace closing” is 1 if the government recommends closing (or work from home), cf. Hale et al. (2021)), but the effect of including recommendations in the index is primarily to shift the index parallelly upward and should not alter the results relative to our focus on mandated NPIs. It is important to note that the index is not perfect. As pointed out by Book (2020), it is certainly possible to identify errors and omissions in the index. However, the index is objective and unbiased and as such, useful for cross-sectional analysis with several observations, even if not suitable for comparing the overall strictness of lockdowns in two countries.

Since the studies examined use different units of estimates, we have created common estimates for Europe and United States to make them comparable. The common estimates show the effect of the average lockdown in Europe and United States (with average stringencies of 76 and 74, respectively, between March 16th and April 15th, 2020, compared to a policy based solely on recommendations (stringency 44)). For example, Ashraf (2020) estimates that the effect of stricter lockdowns is -0.073 to -0.326 deaths/million per stringency point. We use the average of these two estimates (-0.200) in the meta-analysis (see Table 9 in Appendix B for a description for all studies). The average lockdown in Europe between March 16th and April 15th, 2020, was 32 points stricter than a policy solely based on recommendations (76 vs. 44). In United States, it was 30 points. Hence, the total effect of the lockdowns compared to the recommendation policy was -6.37 deaths/million in Europe (32 x -0.200) and -5.91 deaths/million in United States. With populations of 748 million and 333 million, respectively the total effect as estimated by Ashraf (2020) is 4,766 averted COVID-19 deaths in Europe and 1,969 averted COVID-19 deaths in United States. By the end of the study period in Ashraf (2020), which is May 20, 2020, 164,600 people in Europe and 97,081 people in the United States had died of COVID-19. Hence, the 4,766 averted COVID-19 deaths in Europe and the 1,969 averted COVID-19 deaths in the United States corresponds to 2.8% and 2.0% of all COVID-19 deaths, respectively, with an arithmetic average of 2.4%. Our common estimate is thus -2.4%, cf. Table 3. So, this means that Ashraf (2020) estimates that without lockdowns, COVID-19 deaths in Europe would have been 169,366 and COVID-19 deaths in the U.S. would have been 99,050. Our approach is not unproblematic. First of all, the level of stringency varies over time for all countries. We use the stringency between March 16th and April 15th, 2020 because this period covers the main part of the first wave which most of the studies analyze. Secondly, OxCGRT has changed the index over time and a 10-point difference today may not be exactly the same as a 10-point difference when the studies were finalized. However, we believe these problems are unlikely to significantly alter our results.

Public information campaigns,” is not an intervention following our definition, as it is not a mandatory requirement. However, of 97 European countries and U.S. States in the OxCGRT database, only Andorra, Belarus, Bosnia and Herzegovina, Faeroe Islands, and Moldova – less than 1.6% of the population – did not get the maximum score by March 20, 2020, so the parameter simply shifts the index parallelly upward and should not have notable impact on the analyzes.

Table 3 demonstrates that the studies find that lockdowns, on average, have reduced COVID-19 mortality rates by 0.2% (precision-weighted). The results yield a median of -2.4% and an arithmetic average of -7.3%. Only one of the seven studies, Fuller et al. (2021), finds a significant *and* (relative to the effect predicted in studies like Ferguson et al. (2020)) substantial effect of lockdowns (-35%). The other six studies find much smaller effects. Hence, based on the stringency index studies, we find little to no evidence that mandated lockdowns in Europe and the United States had a noticeable effect on COVID-19 mortality rates. And, as will be discussed in the next paragraph, the fifth column of Table 3 displays the number of quality dimensions (out of 4) met by each study.

Table 3: Overview of common estimates from studies based on stringency indexes

Effect on COVID-19 mortality	Estimate (Estimated Averted Deaths / Total Deaths)	Standard error	Weight (1/SE)	Quality dimension s
Bjørnskov (2021)	-0.3%	0.8%	119	3
Shiva and Molana (2021)	-4.1%	0.4%	248	4
Stockenhuber (2020)*	0.0%	n/a	n/a	3
Chisadza et al. (2021)	0.1%	0.0%	7,390	4
Goldstein et al. (2021)	-9.0%	3.8%	26	2
Fuller et al. (2021)	-35.3%	9.1%	11	2
Ashraf (2020)	-2.4%	0.4%	256	2
Precision-weighted average (arithmetic average / median)	-0.2% (-7.3% / -2.4%)			

Note: The table shows the estimates for each study converted to a common estimate, i.e. the implied effect on COVID-19 mortality in Europe and United States. A negative number corresponds to fewer deaths, so -5% means 5% lower COVID-19 mortality. For studies which report estimates in deaths per million, the common estimate is calculated as: (COVID-19 mortality with "common area's" policy) / (COVID-19 mortality with recommendation policy) - 1, where (COVID-19 mortality with recommendation policy) is calculated as ((COVID-19 mortality with "common area's" policy) - Estimate x Difference in stringency x population). Stringencies in Europe and United States are equal to the average stringency from March 16th to April 15th 2020 (76 and 74 respectively) and the stringency for the policy based solely on recommendations is 44 following Hale et al. (2020). For the conversion of other studies see Table 9 in appendix B.

** It is not possible to calculate a common estimate for Stockenhuber (2020). When calculating arithmetic average / median, the study is included as 0%, because estimates are insignificant and signs of estimates are mixed (higher strictness can cause both lower and higher COVID-19 mortality).*

We now turn to the quality dimensions. Table 4 presents the results differentiated by the four quality dimensions. Two studies, Shiva and Molana (2021) and Chisadza et al. (2021), meet all quality dimensions. The precision-weighted average for these studies is 0.0%, meaning that lockdowns had no effect on COVID-19 mortality. Two studies live up to 3 of 4 quality dimensions (Bjørnskov (2021a) and Stockenhuber (2020)). The precision-weighted average for these studies is -0.3%, meaning that lockdowns reduced COVID-19 mortality by 0.3%. Three studies lack at least two quality dimensions.³⁴ These studies find that lockdowns reduce COVID-19 mortality by 4.2%. To sum up, we find that the studies that meet at least 3 of 4 quality measures find that lockdowns have little to no effect on COVID-19 mortality, while studies that

³⁴ In fact, the working papers by P. Goldstein et al. (2021), Fuller et al. (2021) and Ashraf (2020) all lack exactly two quality parameters.

meet 2 of 4 quality measures find a small effect on COVID-19 mortality. These results are far from those estimated with the use of epidemiological models, such as the Imperial College London (Ferguson et al. (2020)).

Table 4: Overview of common estimates split on quality dimensions for studies based on stringency indexes

<i>Values show effect on COVID-19 mortality</i>	Precision-weighted average*	Arithmetic average	Median
Peer-reviewed vs. working papers			
Peer-reviewed [4]	0.0%	-1.1%	-0.2%
Working paper [3]	-4.2%	-15.6%	-9.0%
Long vs. short time period			
Data series ends after 31 May 2020 [6]	-0.1%	-8.1%	-0.2%
Data series ends before 31 May 2020 [1]	-2.4%	-2.4%	-9.0%
No early effect on mortality			
Does not find an effect within the first 14 days (including n/a) [5]	-0.2%	-8.3%	-2.4%
Finds effect within the first 14 days [2]	-1.9%	-4.7%	-4.7%
Social sciences vs. other sciences			
Social sciences [5]	-0.1%	-3.1%	-2.4%
Other sciences [2]	-35.3%	-17.7%	-17.7%
4 of 4 quality dimensions [2]	0.0%	-2.0%	-2.0%
3 of 4 quality dimensions [2]	-0.3%	-0.2%	-0.2%
2 of 4 quality dimensions or fewer [3]	-4.2%	-15.6%	-9.0%

*Note: The table shows the common estimate as described in Table 3 for each quality dimension. The number of studies in each category is in square brackets. * The precision-weighted average does not include studies where no common standard error is available, cf. Table 3.*

Figure 5 shows a funnel plot for the studies in Table 3, except Stockenhuber (2020), where common estimate standard errors cannot be derived. Chisadza et al. (2021) has a far higher precision than the other studies ($1/SE$ is 7,398 and the estimate is 0.1%)³⁵, and there are indications that the estimate from Fuller et al. (2021) (the bottom left) is an imprecise outlier.³⁶ Figure 5 The plot also shows that the studies with at least 3 of 4 quality dimensions are centered around zero and generally have higher precision than other studies.

³⁵ Excluding Chisadza et al. (2021) from the precision-weighted average changes the average to -3.5%.

³⁶ Excluding Fuller et al. (2021) from the precision-weighted average only marginally changes the average because the precision is very low.

Figure 5: Funnel plot for estimates from studies based on stringency indexes

Note: The figure displays all estimates and the precision of the estimate defined as one over the standard error. Studies where standard errors are not available are not included. Studies which live up to at least 3 of 4 quality dimensions are marked with white, while studies which lives up to 2 of 3 quality dimensions or less are marked with black. The vertical line illustrates the precision-weighted average.

Overall conclusion on stringency index studies

Compared to a policy based solely on recommendations, we find little evidence that lockdowns had a noticeable impact on COVID-19 mortality. Only one study, Fuller et al. (2021), finds a substantial effect, while the rest of the studies find little to no effect. Indeed, according to stringency index studies, lockdowns in Europe and the United States reduced only COVID-19 mortality by 0.2% on average.

In the following section we will look at the effect of SIPOs. The section follows the same structure as this section.

4.2 Shelter-in-place order (SIPO) studies

We have identified 13 eligible studies which estimate the effect of Shelter-In-Place Orders (SIPOs) on COVID-19 mortality, cf. Table 5. Seven of these studies look at multiple NPIs of which a SIPO is just one, while six studies estimate the effect of a SIPO vs. no SIPO in the United States. According to the containment and closure policy indicators from OxCGRT, 41 states in the U.S. issued SIPOs in the spring of 2020. But usually, these were introduced after implementing other NPIs such as school closures or workplace closures. On average, SIPOs

were issued 7½ days after *both* schools and workplaces closed, and 12 days after the first of the two closed. Only one state, Tennessee, issued a SIPO before schools and workplaces closed. The 10 states that did not issue SIPOs all closed schools. Moreover, of those 10 states, three closed some non-essential businesses, while the remaining 7 closed all non-essential businesses. Because of this, we perceive estimates for SIPOs based on U.S.-data as the marginal effect of SIPOs on top of other restrictions, although we acknowledge that the estimates may capture the effects of other NPI measures as well.

The results of eligible studies based on SIPOs are presented in Table 5. The table demonstrates that the studies generally find that SIPOs have reduced COVID-19 mortality by 2.9% (on a precision-weighted average). There is an apparent difference between studies in which a SIPO is one of multiple NPIs, and studies in which a SIPO is the only examined intervention. The former group generally finds that SIPOs *increase* COVID-19 mortality *marginally*, whereas the latter finds that SIPOs *decrease* COVID-19 mortality. As we will see below, this difference could be explained by differences in the quality dimensions, and especially the time period covered by each study.

Table 5: Overview of estimates from studies based on SIPOs

<i>Values show effect on COVID-19 mortality</i>	Estimate (Estimated Averted Deaths / Total Deaths)	Standard error	Weight (1/SE)	Quality dimensions
Studies where SIPO is one of several examined interventions and not (as) likely to capture the effect of other interventions				
Chernozhukov et al. (2021)	-17.7%	14.3%	7	4
Chaudhry et al. (2020) *	0.0%	n/a	n/a	2
Aparicio and Grossbard (2021)	2.6%	2.8%	35	4
Stokes et al. (2020)	0.8%	11.1%	9	3
Spiegel and Tookes (2021)	13.1%	6.6%	15	3
Bonardi et al. (2020)	0.0%	n/a	n/a	1
Guo et al. (2021)	4.6%	14.8%	4	3
Average (median) where SIPO is one of several variables	2.8% (0.5%/0.8%)			
Studies where SIPO is the only examined intervention and may capture the effect of other interventions				
Sears et al. (2020)	-32.2%	17.6%	6	2
Alderman and Harjoto (2020)	-1.0%	0.6%	169	4
Berry et al. (2020)	1.1%	n/a	n/a	2
Fowler et al. (2021)	-35.0%	7.0%	14	2
Gibson (2020)	-6.0%	24.3%	4	4
Dave et al. (2020)	-40.8%	36.1%	3	3
Average (median) where SIPO is the only variable	-5.1% (-19.0%/-19.1%)			
Precision-weighted average (arithmetic average / median) for all studies	-2.9% (-8.5%/0.0%)			

Note: * Chaudhry et al. (2020) does not provide an estimate but states that SIPO is insignificant. We use 0% when calculating the arithmetic average and median. Chaudhry et al. (2020) and Berry et al. (2021) do not affect the precision-weighted average, as we do not know the standard errors.

Table 6 presents the results differentiated by quality dimensions. Four studies (Chernozhukov et al. (2021), Aparicio and Grossbard (2021), Alderman and Harjoto (2020) and Gibson (2020))

meet all quality dimensions but find vastly different effects of SIPOs on COVID-19 mortality. The precision weighted average of the four studies is -1.0%. Four studies meet 3 of 4 quality dimensions. They overall find that SIPOs *increase* COVID-19 mortality, as the precision-weighted average is positive (3.7%). The five studies that meet 2 of 4 quality dimensions or fewer³⁷ find a substantial reduction in COVID-19-mortality (-34.2%). This substantial reduction seems to be driven by relatively short data series. The latest data point for the three studies which find large effects of lockdowns (Sears et al. (2020), Fowler et al. (2021), and Dave et al. (2021)) are April 29, May 7, and April 20, respectively. This may indicate that SIPOs can delay deaths but not eliminate them completely. Disregarding these studies with short data series, the precision-weighted average is -0.1%.

Table 6: Quality dimensions for studies based on SIPOs

<i>Values show effect on COVID-19 mortality</i>	Precision-weighted average*	Arithmetic average	Median
Peer-reviewed vs. working papers			
Peer-review [10]	-2.4%	-7.9%	-0.5%
Working paper [3]	-12.0%	-10.5%	0.0%
Long vs. short time period			
Data serie ends after 31 May 2020 [6]	-0.1%	-1.4%	-0.1%
Data serie ends before 31 May 2020 [7]	-25.9%	-14.6%	0.0%
No early effect on mortality			
Finds effect within the first 14 days [9]	-2.0%	-10.0%	-1.0%
Does not find an effect within the first 14 days (including n/a) [4]	-10.3%	-5.2%	0.0%
Social sciences vs. other sciences			
Social sciences [12]	-2.9%	-9.2%	-0.5%
Other sciences [1]	n/a	0.0%	0.0%
4 of 4 quality dimensions [4]	-1.0%	-5.5%	-3.5%
3 of 4 quality dimensions [4]	3.7%	-5.6%	2.7%
2 of 4 quality dimensions or fewer [5]	-34.2%	-13.2%	0.0%

*Note: The table shows the common estimate as described in Table 5 for each quality dimension. The number of studies in each category is in square brackets. * The precision-weighted average does not include studies where no common standard error is available, cf. Table 5.*

Figure 6 shows a funnel plot for the studies in Table 5, except Chaudhry et al. (2020) and Berry et al. (2021), where common standard errors cannot be derived. Sears et al. (2020) stands out with a precision far higher than those of the other studies. But generally, the precisions of the studies are low and the estimates are placed on both sides of the zero-line with some ‘tail’ to the

³⁷ Bonardi et al. (2020) only meet one quality dimension (social science).

left.³⁸ Figure 5 also shows that four of eight studies with at least 3 of 4 quality dimensions find that SIPOs *increase* COVID-19 mortality by 0.8% to 13.1%.

Figure 6: Funnel plot for estimates from SIPO studies

Note: The figure displays all estimates and the precision of the estimate defined as one over the standard error. Studies where standard errors are not available are not included. Studies which live up to at least 3 of 4 quality dimensions are marked with white, while studies which lives up to 2 of 4 quality dimensions or less are marked with black. The vertical line illustrates the precision-weighted average.

Overall conclusion on SIPO studies

We find no clear evidence that SIPOs had a noticeable impact on COVID-19 mortality. Some studies find a large negative relationship between lockdowns and COVID-19 mortality, but this seems to be caused by short data series which does not cover a full COVID-19 ‘wave’. Several studies find a small positive relationship between lockdowns and COVID-19 mortality. Although this appears to be counterintuitive, it could be the result of an (asymptomatic) infected person being isolated at home under a SIPO can infect family members with a higher viral load causing more severe illness.³⁹ The overall effect measured by the precision-weighted average is -2.9%. The result is in line with Nuzzo et al. (2019), who state that “In the context of a high-impact

³⁸ This could indicate some publication bias, but the evidence is weak and with only 13 estimates, this cannot be formally tested

³⁹ E.g. see Guallar et al. (2020), who concludes, “Our data support that a greater viral inoculum at the time of SARS-CoV-2 exposure might determine a higher risk of severe COVID-19.”

respiratory pathogen, quarantine may be the least likely NPI to be effective in controlling the spread due to high transmissibility” and World Health Organization Writing Group (2006), who conclude that “forced isolation and quarantine are ineffective and impractical.”⁴⁰

In the following section, we will look at the effect found in studies analyzing specific NPIs.

4.3 Studies of specific NPIs

A total of 11 eligible studies look at (multiple) specific NPIs independently or simply lockdown vs. no lockdown.⁴¹ The definition of the specific NPIs varies from study to study and are somewhat difficult to compare. The variety in the definitions can be seen in the analysis of non-essential business closures and bar/restaurant closures. Chernozhukov et al. (2021) focus on a combined parameter (the average of business closure and bar/restaurant closure in each state), Aparicio and Grossbard (2021) look at business closure but not bar/restaurant closure, Spiegel and Tookes (2021) examine bar/restaurant closure but not business closure, and Guo et al. (2021) look at both business closures and bar/restaurant closures independently.

Some studies include several NPIs (e.g. Stokes et al. (2020) and Spiegel and Tookes (2021)), while others cover very few. Bongaerts et al. (2021) only study business closures, and Leffler et al. (2020) look at internal lockdown and international travel restrictions). Few NPIs in a model are potentially a problem because they can capture the effect of excluded NPIs. On the other hand, several NPIs in a model increase the risk of multiple test bias.

The differences in the choice of NPIs and in the number of NPIs make it challenging to create an overview of the results. In Table 7, we have merged the results in six overall categories but note that the estimates may not be fully comparable across studies. In particular, the lockdown-measure varies from study to study and in some cases is poorly defined by the authors. Also, there are only a few estimates within some of the categories. For instance, the estimate of the effect of facemasks is based on only two studies.

Table 7 illustrates that generally there is no evidence of a noticeable relationship between the most-used NPIs and COVID-19. Overall, lockdowns and limiting gatherings seem to increase COVID-19 mortality, although the effect is modest (0.6% and 1.6%, respectively) and border closures has little to no effect on COVID-19 mortality, with a precision-weighted average of -0.1% (removing the imprecise outlier from Guo et al. (2021) changes the precision-weighted average to -0.2%). We find a small effect of school closure (-4.4%), but this estimate is mainly driven by Auger et al. (2020), who – as noted earlier – use an “interrupted time series study”

⁴⁰ Both Nuzzo et al. (2019) and World Health Organization Writing Group (2006) focus on quarantining infected persons. However, if quarantining infected persons is not effective, it should be no surprise that quarantining uninfected persons could be ineffective too.

⁴¹ Note that we – according to our search strategy – did not search on specific measures such as “school closures” but on words describing the overall political approach to the COVID-19 pandemic such as “non-pharmaceutical,” “NPIs,” “lockdown” etc.

approach and may capture other effects such as seasonal and behavioral effects. The absence of a notable effect of school closures is in line with Irfan et al. (2021), who – based on a systematic review and meta-analysis of 90 published or preprint studies of transmission in children – concluded that “risks of infection among children in educational-settings was lower than in communities. Evidence from school-based studies demonstrate it is largely safe for young children (<10 years of age) to be at schools; however, older children (between 10 and 19 years of age) might facilitate transmission.” UNICEF (2021) and ECDC (2020) reach similar conclusions.⁴²

Mandating facemasks – an intervention that was not widely used in the spring of 2020, and in many countries was even discouraged – seems to have a large effect (-21.2%), but this conclusion is based on only two studies.⁴³ Again, our categorization may play a role, as the larger mask-estimate from Chernozhukov et al. (2021) is in fact “employee facemasks,” not a general mask mandate. Our findings are somewhat in contrast to the result found in a review by Liu et al. (2021), who conclude that “fourteen of sixteen identified randomized controlled trials comparing face masks to no mask controls failed to find statistically significant benefit in the intent-to-treat populations.” Similarly, a pre-COVID Cochrane review concludes, “There is low certainty evidence from nine trials (3507 participants) that wearing a mask may make little or no difference to the outcome of influenza-like illness (ILI) compared to not wearing a mask (risk ratio (RR) 0.99, 95% confidence interval (CI) 0.82 to 1.18). There is moderate certainty evidence that wearing a mask probably makes little or no difference to the outcome of laboratory-confirmed influenza compared to not wearing a mask (RR 0.91, 95% CI 0.66 to 1.26; 6 trials; 3005 participants)” (Jefferson et al. (2020)).⁴⁴ However, it should be noted that even if no effect is found in controlled settings, this does not necessarily imply that mandated face masks does not reduce mortality, as other factors may play a role (e.g. wearing a mask may function as a tax on socializing if people are bothered by wearing a face masks when they are socializing).

⁴² UNICEF (2021) concludes, “The preliminary findings thus far suggest that in-person schooling – especially when coupled with preventive and control measures – had lower secondary COVID-19 transmission rates compared to other settings and do not seem to have significantly contributed to the overall community transmission risks.” Whereas, ECDC (2020) conclude, “School closures can contribute to a reduction in SARS-CoV-2 transmission, but by themselves are insufficient to prevent community transmission of COVID-19 in the absence of other nonpharmaceutical interventions (NPIs) such as restrictions on mass gathering,” and states, “There is a general consensus that the decision to close schools to control the COVID-19 pandemic should be used as a last resort. The negative physical, mental health and educational impact of proactive school closures on children, as well as the economic impact on society more broadly, would likely outweigh the benefits.”

⁴³ Note again, that we – according to our search strategy – did not search on the specific measures such as “masks,” “face masks,” “surgical masks” but on words describing the overall political approach to the COVID-19 pandemic such as “non-pharmaceutical,” “NPIs,” “lockdown” etc. Thus, we do not include most of the studies in mask reviews such as Liu et al. (2021) and Jefferson et al. (2020).

⁴⁴ Lipp and Edwards (2014) also find no evidence of an effect and – looking at disposable surgical face masks for preventing surgical wound infection in clean surgery – conclude, “Three trials were included, involving a total of 2113 participants. There was no statistically significant difference in infection rates between the masked and unmasked group in any of the trials.” Meanwhile, Li et al. (2021) – based on six case-control studies – conclude, “In general, wearing a mask was associated with a significantly reduced risk of COVID-19 infection (OR = 0.38, 95% CI: 0.21-0.69, $I^2 = 54.1\%$).

Only business closure consistently shows evidence of a negative relationship with COVID-19 mortality, but the variation in the estimated effect is large. Three studies find little to no effect, and three find large effects. Two of the larger effects are related to closing bars and restaurants. The “close business” category in Chernozhukov et al. (2021) is an average of closed businesses, restaurants, and movie theaters, while that same category is “closing restaurants and bars” in Spiegel and Tookes (2021). The last study finding a large effect is Bongaerts et al. (2021), the only eligible single-country study.⁴⁵

As a final observation on Table 7, studies with fewer quality dimensions seem to find larger effects, but the pattern is not systematic.⁴⁶

Table 7: Overview of estimates from studies of specific NPIs

	Lockdown (complete/ partial)	Facemasks/ Employee face masks	Business closure (/bars & restaurants)	Border closure (/quarantine)	School closures	Limiting gatherings	Quality dimensions
Chernozhukov et al. (2021)		-34.0%	-28.6%				4

*Note: * It is not possible to derive common estimates and standard errors from Chaudhry et al. (2020) and Bonardi et al. (2020). Chaudhry et al. (2020) states that the effect of the various NPIs is insignificant without listing the estimates and standard errors. Bonardi et al. (2020) states that partial or regional lockdowns are as effective as stricter NPIs but does not provide information to calculate common estimates. Instead, we assume the estimate is 0% when calculating arithmetic average and median, while the estimates are excluded from the calculation of precision-weighted averages because there are no standard errors.*

⁴⁵ Bongaerts et al. (2021) (implicitly) assume that municipalities with different exposures to closed sectors are not inherently different, which may be a relatively strong assumption and could potentially drive their results.

⁴⁶ We saw with SIPOs that studies based on short data series tended to find larger effects than studies based on short data series. This is also somewhat true for studies examining multiple specific measures. If we focus on studies with long data series (>May 31st, 2020), the precision-weighted estimates are as follows (average for all studies in parentheses for easy comparison): Lockdown (complete/partial): 0.5% (0.6%), Facemasks/Employee face masks: -21.2% (-21.2%), Business closures (/bars & restaurants): -8.1% (-10.6%), Border closures (/quarantine): -0.1% (-0.1%), School closures: 0.5% (-4.4%), Limiting gatherings: 1.4% (1.6%).

Figure 7 shows a funnel plot for all estimates in Table 7, except Chaudhry et al. (2020) and Bonardi et al. (2020), where common standard errors cannot be derived. Two estimates from Toya and Skidmore (2020) stands out with a precision far higher than those of other studies, and estimates are placed with some ‘tail’ to the left, which could indicate some publication bias, i.e. reluctance to publish results that show large positive (more deaths) effects of lockdowns. The most precise estimates are gathered around 0%, while less precise studies are spread out between -58% and 36%. The precision-weighted average of all estimates across all NPIs is -0.6%.

Figure 7: Funnel plot for estimates from studies of specific NPIs

Note: The figure displays all estimates except two (see text in figure) of specific NPIs and the precision of the estimate defined as one over the standard error. Studies where standard errors are not available are not included.

Overall conclusion on specific NPIs

Because of the heterogeneity in NPIs across studies, it is difficult to draw strong conclusions based on the studies of multiple specific measures. We find no evidence that lockdowns, school closures, border closures, and limiting gatherings have had a noticeable effect on COVID-19 mortality. There is some evidence that business closures reduce COVID-19 mortality, but the variation in estimates is large and the effect seems related to closing bars. There may be an effect of mask mandates, but just two studies look at this, one of which one only looks at the effect of employee mask mandates.

5 Concluding observations

Public health experts and politicians have – based on forecasts in epidemiological studies such as that of Imperial College London (Ferguson et al. (2020) – embraced compulsory lockdowns as an effective method for arresting the pandemic. But, have these lockdown policies been effective in curbing COVID-19 mortality? This is the main question answered by our meta-analysis.

Adopting a systematic search and title-based screening, we identified 1,048 studies published by July 1st, 2020, which potentially look at the effect of lockdowns on mortality rates. To answer our question, we focused on studies that examine the actual impact of lockdowns on COVID-19 mortality rates based on registered cross-sectional mortality data and a counterfactual difference-in-difference approach. Out of the 1,048 studies, 34 met our eligibility criteria.

Conclusions

Overall, our meta-analysis fails to confirm that lockdowns have had a large, significant effect on mortality rates. Studies examining the relationship between lockdown strictness (based on the OxCGRT stringency index) find that the average lockdown in Europe and the United States only reduced COVID-19 mortality by 0.2% compared to a COVID-19 policy based solely on recommendations. Shelter-in-place orders (SIPOs) were also ineffective. They only reduced COVID-19 mortality by 2.9%.

Studies looking at specific NPIs (lockdown vs. no lockdown, facemasks, closing non-essential businesses, border closures, school closures, and limiting gatherings) also find no broad-based evidence of noticeable effects on COVID-19 mortality. However, closing non-essential businesses seems to have had some effect (reducing COVID-19 mortality by 10.6%), which is likely to be related to the closure of bars. Also, masks may reduce COVID-19 mortality, but there is only one study that examines universal mask mandates. The effect of border closures, school closures and limiting gatherings on COVID-19 mortality yields precision-weighted estimates of -0.1%, -4.4%, and 1.6%, respectively. Lockdowns (compared to no lockdowns) also do not reduce COVID-19 mortality.

Discussion

Overall, we conclude that lockdowns are not an effective way of reducing mortality rates during a pandemic, at least not during the first wave of the COVID-19 pandemic. Our results are in line with the World Health Organization Writing Group (2006), who state, “Reports from the 1918 influenza pandemic indicate that social-distancing measures did not stop or appear to dramatically reduce transmission [...] In Edmonton, Canada, isolation and quarantine were instituted; public meetings were banned; schools, churches, colleges, theaters, and other public gathering places were closed; and business hours were restricted without obvious impact on the epidemic.” Our findings are also in line with Allen's (2021) conclusion: “The most recent research has shown that lockdowns have had, at best, a marginal effect on the number of Covid-19 deaths.” Poeschl and Larsen (2021) conclude that “interventions are generally effective in

mitigating COVID-19 spread”. But, 9 of the 43 (21%) results they review find “no or uncertain association” between lockdowns and the spread of COVID-19, suggesting that evidence from that own study contradicts their conclusion.

The findings contained in Johanna et al. (2020) are in contrast to our own. They conclude that “for lockdown, ten studies consistently showed that it successfully reduced the incidence, onward transmission, and mortality rate of COVID-19.” The driver of the difference is three-fold. First, Johanna et al. include modelling studies (10 out of a total of 14 studies), which we have explicitly excluded. Second, they included interrupted time series studies (3 of 14 studies), which we also exclude. Third, the only study using a difference-in-difference approach (as we have done) is based on data collected before May 1st, 2020. We should mention that our results indicate that early studies find relatively larger effects compared to later studies.

Our main conclusion invites a discussion of some issues. Our review does not point out *why* lockdowns did not have the effect promised by the epidemiological models of Imperial College London (Ferguson et al. (2020)). We propose four factors that might explain the difference between our conclusion and the view embraced by some epidemiologists.

First, people respond to dangers outside their door. When a pandemic rages, people believe in social distancing regardless of what the government mandates. So, we believe that Allen (2021) is right, when he concludes, “The ineffectiveness [of lockdowns] stemmed from individual changes in behavior: either non-compliance or behavior that mimicked lockdowns.” In economic terms, you can say that the demand for costly disease prevention efforts like social distancing and increased focus on hygiene is high when infection rates are high. Contrary, when infection rates are low, the demand is low and it may even be morally and economically rational not to comply with mandates like SIPOs, which are difficult to enforce. Herby (2021) reviews studies which distinguish between mandatory and voluntary behavioral changes. He finds that – on average – voluntary behavioral changes are 10 times as important as mandatory behavioral changes in combating COVID-19. If people voluntarily adjust their behavior to the risk of the pandemic, closing down non-essential businesses may simply reallocate consumer visits away from “nonessential” to “essential” businesses, as shown by Goolsbee and Syverson (2021), with limited impact on the total number of contacts.⁴⁷ This may also explain why epidemiological model simulations such as Ferguson et al. (2020) – which do not model behavior endogenously – fail to forecast the effect of lockdowns.

Second, mandates only regulate a fraction of our potential contagious contacts and can hardly regulate nor enforce handwashing, coughing etiquette, distancing in supermarkets, etc. Countries like Denmark, Finland, and Norway that realized success in keeping COVID-19 mortality rates relatively low allowed people to go to work, use public transport, and meet privately at home during the first lockdown. In these countries, there were ample opportunities to legally meet with others.

⁴⁷ In economic terms, lockdowns are substitutes for – not complements to – voluntary behavioral changes.

Third, even if lockdowns are successful in initially reducing the spread of COVID-19, the behavioral response may counteract the effect completely, as people respond to the lower risk by changing behavior. As Atkeson (2021) points out, the economic intuition is straightforward. If closing bars and restaurants causes the prevalence of the disease to fall toward zero, the demand for costly disease prevention efforts like social distancing and increased focus on hygiene also falls towards zero, and the disease will return.⁴⁸

Fourth, unintended consequences may play a larger role than recognized. We already pointed to the possible unintended consequence of SIPOs, which may isolate an infected person at home with his/her family where he/she risks infecting family members with a higher viral load, causing more severe illness. But often, lockdowns have limited peoples' access to safe (outdoor) places such as beaches, parks, and zoos, or included outdoor mask mandates or strict outdoor gathering restrictions, pushing people to meet at less safe (indoor) places. Indeed, we do find some evidence that limiting gatherings was counterproductive and increased COVID-19 mortality.

One objection to our conclusions may be that we do not look at the role of timing. If timing is very important, differences in timing may empirically overrule any differences in lockdowns. We note that this objection is not necessarily in contrast to our results. If timing is very important relative to strictness, this suggests that well-timed, but very mild, lockdowns should work as well as, or better than, less well-timed but strict lockdowns. This is not in contrast to our conclusion, as the studies we reviewed analyze the effect of lockdowns compared but to doing very little (see Section 3.1 for further discussion). However, there is little solid evidence supporting the timing thesis, because it is inherently difficult to analyze (see Section 2.2 for further discussion). Also, even if it can be empirically stated that a well-timed lockdown is effective in combating a pandemic, it is doubtful that this information will ever be useful from a policy perspective.

But, what explains the differences between countries, if not differences in lockdown policies? Differences in population age and health, quality of the health sector, and the like are obvious factors. But several studies point at less obvious factors, such as culture, communication, and coincidences. For example, Frey et al. (2020) show that for the same policy stringency, countries with more obedient and collectivist cultural traits experienced larger declines in geographic mobility relative to their more individualistic counterpart. Data from Germany Laliotis and Minos (2020) shows that the spread of COVID-19 and the resulting deaths in predominantly Catholic regions with stronger social and family ties were much higher compared to non-Catholic ones at the local NUTS 3 level.⁴⁹

Government communication may also have played a large role. Compared to its Scandinavian neighbors, the communication from Swedish health authorities was far more subdued and embraced the idea of public health vs. economic trade-offs. This may explain why Helsingen et

⁴⁸ This kind of behavior response may also explain why Subramanian and Kumar (2021) find that increases in COVID-19 cases are unrelated to levels of vaccination across 68 countries and 2947 counties in the United States. When people are vaccinated and protected against severe disease, they have less reason to be careful.

⁴⁹ The NUTS classification (Nomenclature of territorial units for statistics) is a hierarchical system for dividing up the economic territory of the EU and the UK. There are 1215 regions at the NUTS 3-level.

al. (2020), found, based on questionnaire data collected from mid-March to mid-April, 2020, that even though the daily COVID-19 mortality rate was more than four times higher in Sweden than in Norway, Swedes were less likely than Norwegians to not meet with friends (55% vs. 87%), avoid public transportation (72% vs. 82%), and stay home during spare time (71% vs. 87%). That is, despite a more severe pandemic, Swedes were less affected in their daily activities (legal in both countries) than Norwegians.

Many other factors may be relevant, and we should not underestimate the importance of coincidences. An interesting example illustrating this point is found in Arnarson (2021) and Björk et al. (2021), who show that areas where the winter holiday was relatively late (in week 9 or 10 rather than week 6, 7 or 8) were hit especially hard by COVID-19 during the first wave because the virus outbreak in the Alps could spread to those areas with ski tourists. Arnarson (2021) shows that the effect persists in later waves. Had the winter holiday in Sweden been in week 7 or week 8 as in Denmark, the Swedish COVID-19 situation could have turned out very differently.⁵⁰

Policy implications

In the early stages of a pandemic, before the arrival of vaccines and new treatments, a society can respond in two ways: mandated behavioral changes or voluntary behavioral changes. Our study fails to demonstrate significant positive effects of mandated behavioral changes (lockdowns). This should draw our focus to the role of voluntary behavioral changes. Here, more research is needed to determine how voluntary behavioral changes can be supported. But it should be clear that one important role for government authorities is to provide information so that citizens can voluntarily respond to the pandemic in a way that mitigates their exposure.

Finally, allow us to broaden our perspective after presenting our meta-analysis that focuses on the following question: “What does the evidence tell us about the effects of lockdowns on mortality?” We provide a firm answer to this question: The evidence fails to confirm that lockdowns have a significant effect in reducing COVID-19 mortality. The effect is little to none.

The use of lockdowns is a unique feature of the COVID-19 pandemic. Lockdowns have not been used to such a large extent during any of the pandemics of the past century. However, lockdowns during the initial phase of the COVID-19 pandemic have had devastating effects. They have contributed to reducing economic activity, raising unemployment, reducing schooling, causing political unrest, contributing to domestic violence, and undermining liberal democracy. These costs to society must be compared to the benefits of lockdowns, which our meta-analysis has shown are marginal at best. Such a standard benefit-cost calculation leads to a strong conclusion: lockdowns should be rejected out of hand as a pandemic policy instrument.

⁵⁰ Another case of coincidence is illustrated by Shenoy et al. (2022), who find that areas that experienced rainfall early in the pandemic realized fewer deaths because the rainfall induced social distancing.

6 Appendix A. The role of timing

Some of the included papers study the importance of the timing of lockdowns, while several other papers only looking at timing of (but not on the inherent effect of) lockdowns have been excluded from the literature list in this review. There's no doubt that being prepared for a pandemic and knowing when it arrives at your doorstep is vital. However, two problems arise with respect to imposing early lockdowns.

First of all, it was virtually impossible to determine the right timing when COVID-19 hit Europe and the United States. The World Health Organization declared the outbreak of a pandemic on 11 March 2020, but at that date Italy had already registered 13.7 COVID-19-deaths per million (all infected before approximately 22 February, because of the roughly 18 day gap between infection and death, c.f. e.g.. Bjørnskov (2021a)). On 29 March 2020, 18 days after WHO declared the outbreak a pandemic and the earliest a lockdown response to WHO's announcement could have an effect, the death toll in Italy was a staggering 178 COVID-19-deaths per million with an additionally 13 per million dying each day.

There are reasons to believe that many countries and regions were hit particularly hard during the first wave of COVID, because they had no clue about how bad it really was. This point is illustrated in Figure 8 (and Figure 9), which show that countries (and states), which were hit hard and early, experienced large death tolls compared to countries where the pandemic had a slower start. Björk et al. (2021) and Arnarson (2021) show that areas with a winter holiday in week 10 and – especially – week 9 were hit hard, because they imported cases from the Alps *before* they knew the pandemic was wide spread at the ski resorts. Hence, while acting early by warning citizens and closing business may be an effective strategy; this was not a feasible strategy for most countries in the spring of 2020.

The second problem is that it is extremely difficult to differentiate between the effect of public awareness and the effect of lockdowns. If people and politicians react to the same information, for example deaths in geographical neighboring countries (many EU-countries reacted to deaths in Italy) or in another part of the same country, the effect of lockdowns cannot easily be separated from the effect of voluntary social distancing or, use of hand sanitizers. Hence, we find it problematic to use national lockdowns and differences in the progress of the pandemic in different regions to say anything about the effect of early lockdowns on the pandemic, as the estimated effect might just as well come from voluntary behavior changes, when people in Southern Italy react to the situation in Northern Italy.

We have seen no studies which we believe credibly separate the effect of early lockdown from the effect of early voluntary behavior changes. Instead, the estimates in these studies capture the effects of lockdowns *and* voluntary behavior changes. As Herby (2021) illustrates, voluntary behavior changes are essential to a society's response to an pandemic and can account for up to 90% of societies' total response to the pandemic.

Including these studies will greatly overestimate the effect of lockdowns, and, hence, we chose not to include studies focusing on timing of lockdowns in our review.

Ylli et al. (2020); "The lower COVID-19 related mortality and incidence rates in Eastern European countries are associated with delayed start of community circulation Alban"	Not effect of lockdowns

7.2 Interpretation of estimates and conversion to common estimates

In Table 9, we describe for each study used in the meta-analysis how we interpret their results and convert the estimates to our common estimate. Standard errors are converted such that the t-value, calculated based on common estimates and standard errors, is unchanged. When confidence intervals are reported rather than standard errors, we calculate standard errors using t-distribution with ∞ degrees of freedom (i.e. 1.96 for 95% confidence interval).

Table 9: Notes on studies included in the meta-analysis

1. Study (Author & title)	2. Date Published	3. Journal	4. Comments regarding meta-analysis
Alderman and Harjoto (2020); "COVID-19: U.S. shelter-in-place orders and demographic characteristics linked to cases, mortality, and recovery rates"	26-Nov-20	Transforming Government: People, Process and Policy	We use the 1% effect noted by the authors in "We find that the natural log of the duration (in days) that the state instituted shelter-in-place reduces percentages of mortality by 0.0001%, or approximately 1% of the means of percentages of deaths per capita in our sample. The standard error is calculated on basis of the t-value in Table 3.
Aparicio and Grossbard (2021); "Are Covid Fatalities in the U.S. Higher than in the EU, and If so, Why?"	16-Jan-21	Review of Economics of the Household	We use estimates from Table 3, model 5. For each estimate the common estimate is calculated as (difference in COVID-19 mortality with NPI)/(difference in COVID-19 mortality without NPI)-1, where (difference in COVID-19 mortality with NPI) is 237.89 (Table 2 states that deaths per million is 406.99 in U.S. and 169.10 in Europe) and (difference in COVID-19 mortality without NPI) is estimated as $\exp(\ln(\text{difference in COVID-19 mortality with NPI}) - \text{estimate})$.
Ashraf (2020); "Socioeconomic conditions, government interventions and health outcomes during COVID-19"	1-Jul-20	ResearchGate	It is unclear whether they prefer the model with or without the interaction term. In the meta-analysis, we use an average of -0.326 (Table 3, without) and -0.073 (Table 6, with) deaths per million per stringency point (i.e. -0.200). The common estimate is the average effect in Europe and United States respectively calculated as (Actual COVID-19 mortality) / (COVID-19 mortality with recommendation policy) - 1, where (COVID-19 mortality with recommendation policy) is calculated as ((Actual COVID-19 mortality) - Estimate x Difference in stringency x population). Stringencies in Europe and United States are equal to the average stringency from March 16th to April 15th 2020 (76 and 74 respectively) and the stringency for the policy based solely on recommendations is 44 following Hale et al. (2020).

1. Study (Author & title)	2. Date Published	3. Journal	4. Comments regarding meta-analysis
Auger et al. (2020); "Association between statewide school closure and COVID-19 incidence and mortality in the U.S."	1-Sep-20	JAMA	Estimate that school closure was associated with a 58% decline in COVID-19 mortality and that the effect was largest in states with low cumulative incidence of COVID-19 at the time of school closure. States with the lowest incidence of COVID-19 had a -72% relative change in incidence compared with -49% for those states with the highest cumulative incidence.
Berry et al. (2021); "Evaluating the effects of shelter-in-place policies during the COVID-19 pandemic"	24-Feb-21	PNAS	The estimated effect of SIPO's, an increase in deaths by 0,654 per million after 14 days (significant, cf. Fig. 2), is converted to a relative effect on a state basis based on data from OurWorldInData. For states which did implement SIPO, we calculate the number of deaths without SIPO as the number of official COVID-19 deaths 14 days after SIPO was implemented minus 0,654 extra deaths per million. For states which did not implement SIPO, we calculate the number of deaths with SIPO as the number of official COVID-19 deaths 14 days after March 31 2020 plus 0,654 extra deaths per million. We use March 31 2020 as this was the average date on which SIPO was implemented in the 40 states which did implement SIPO. Using this approximation, the effect of SIPO's in the U.S. is 1,1% more deaths after 14 days. Common standard errors are not available.
Bjørnskov (2021a); "Did Lockdown Work? An Economist's Cross-Country Comparison"	29-Mar-21	CESifo Economic Studies	We use estimates from Table 2 (four weeks). Common estimate is calculated as the average of the effect in Europe and United States, where the effect for each is calculated as $(\ln(\text{policy stringency}) - \ln(\text{recommendation stringency})) \times \text{estimate}$.
Blanco et al. (2020); "Do Coronavirus Containment Measures Work? Worldwide Evidence"	1-Dec-20	World Bank Group	The study is not included in the meta-analysis, as it looks at the effect of NPIs on growth rates and does not include an estimate of the effect on total mortality.
Bonardi et al. (2020); "Fast and local: How did lockdown policies affect the spread and severity of the covid-19"	8-Jun-20	0	Find that, world-wide, internal NPIs have prevented about 650,000 deaths (3.11 deaths were prevented for each death that occurred, i.e. 76% effect). However, this effect is for any lockdown including a Swedish lockdown. They do not find an extra effect of stricter lockdowns and state that "our results point to the fact that people might adjust their behaviors quite significantly as partial measures are implemented, which might be enough to stop the spread of the virus." Hence, whether the baseline is Sweden, which implemented a ban on large gatherings early in the pandemic, or the baseline is "doing nothing" can affect the magnitude of the estimated impacts. Since all Western countries did something and estimates in other reviewed studies are relative to doing less – and, hence not to doing nothing, we report the result from Bonardi et al. as compared to "doing less." Hence, for Bonardi et al. we use 0% as the common estimate in the meta-analysis for each NPI (SIPO, regional lockdown, partial lockdown, and border closure (stage 1, stage 2 and full) because all NPIs are insignificant (compared to Sweden's "doing the least"-lockdown).
Bongaerts et al. (2021); "Closed for business: The mortality impact of business closures during the Covid-19 pandemic"	14-May-21	PLOS ONE	Business shutdown saved 9,439 Italian lives by 13th 2020. This corresponds to 32%, as there were 20,465 COVID-19-deaths in Italy by mid April 2020.
Chaudhry et al. (2020); "A country level analysis measuring the impact of government actions, country preparedness and socioeconomic factors on COVID-19 mortality and related health outcomes"	1-Aug-20	Eclinical-Medicine	Finds no effect of partial border closure, complete border closure, partial lockdown (physical distancing measures only), complete lockdown (enhanced containment measures including suspension of all non-essential services), and curfews. In the meta-analysis we use a common estimate of 0%, as estimates and standard errors are not available.
Chernozhukov et al. (2021); "Causal impact of masks, policies, behavior on early covid-19 pandemic in the U.S."	1-Jan-21	Journal of Econometrics	The study looks at the effect of NPIs on growth rates but does include an estimate of the effect on total mortality at the end of the study period for employee face masks (-34%), business closure (-29%). and SIPO (-18%), but not for school closures (which we therefore exclude). In reporting the results of their counterfactual, they alter between "fewer deaths with NPI" and "more deaths without NPI." We have converted the latter to the former as $\text{estimate}/(1+\text{estimate})$ so "without business closures deaths would be about 40% higher" corresponds to "with business closures deaths would be about 29% lower."
Chisadza et al. (2021); "Government Effectiveness and the COVID-19 Pandemic"	10-Mar-21	MDPI	The common estimate is the average effect in Europe and United States respectively calculated as $(\text{Actual COVID-19 mortality}) / (\text{COVID-19 mortality with recommendation policy}) - 1$, where $(\text{COVID-19 mortality with recommendation policy})$ is calculated as $(\text{Actual COVID-19 mortality}) - \text{Estimate} \times \text{Difference in stringency} \times \text{population}$. Stringencies in Europe and United States are equal to the average stringency from March 16th to April 15th 2020 (76 and 74 respectively) and the stringency for the policy based solely on recommendations is 44 following Hale et al. (2020). In the meta-analysis we use the non-linear estimate, but the squared estimate yields similar results.
Dave et al. (2021); "When Do Shelter-in-Place Orders"	3-Aug-20	Economic Inquiry	The study looks at the effect of SIPO's on growth rates but does include an estimate of the effect on total mortality after 20+ days for model 1 and 2 in Table 7. Since model 3, 4 and 5 have estimates

1. Study (Author & title)	2. Date Published	3. Journal	4. Comments regarding meta-analysis
Fight Covid-19 Best? Policy Heterogeneity Across States and Adoption Time"			similar to model 2, we use an average of model 1 to 5, where the estimates of model 3 to 5 are calculated as (common estimate model 2) / (estimate model 2) x estimate model 3/4/5.
Dergiades et al. (2020); "Effectiveness of government policies in response to the COVID-19 outbreak"	28-Aug-20	SSRN	The study is not included in the meta-analysis, as it looks at the effect of NPIs on growth rates and does not include an estimate of the effect on total mortality.
Fakir and Bharati (2021); "Pandemic catch-22: The role of mobility restrictions and institutional inequalities in halting the spread of COVID-19"	28-Jun-21	PLOS ONE	The study is not included in the meta-analysis, as it looks at the effect of NPIs on growth rates and does not include an estimate of the effect on total mortality.
Fowler et al. (2021); "Stay-at-home orders associate with subsequent decreases in COVID-19 cases and fatalities in the United States"	10-Jun-21	PLOS ONE	The study looks at the effect of SIPO's on growth rates but does include an estimate of the effect on total mortality after three weeks (35% reduction in deaths) which is used in the meta-analysis.
Fuller et al. (2021); "Mitigation Policies and COVID-19-Associated Mortality – 37 European Countries, January 23–June 30, 2020"	15-Jan-21	Morbidity and Mortality Weekly Report	For each 1-unit increase in OxCGRT stringency index, the cumulative mortality decreases by 0.55 deaths per 100,000. The common estimate is the average effect in Europe and United States respectively calculated as (Actual COVID-19 mortality) / (COVID-19 mortality with recommendation policy) -1, where (COVID-19 mortality with recommendation policy) is calculated as ((Actual COVID-19 mortality) - Estimate x Difference in stringency x population). Stringencies in Europe and United States are equal to the average stringency from March 16th to April 15th 2020 (76 and 74 respectively) and the stringency for the policy based solely on recommendations is 44 following Hale et al. (2020).
Gibson (2020); "Government mandated lockdowns do not reduce Covid-19 deaths: implications for evaluating the stringent New Zealand response"	18-Aug-20	New Zealand Economic Papers	We use the two graphs to the left in figure 3, where we extract the data from the rightmost datapoint (i.e. % impact of county lockdowns on Covid-19 deaths by 1/06/2020). We then take the average of the estimates found in the two graphs, because it is unclear which estimate the author prefers.
Goldstein et al. (2021); "Lockdown Fatigue: The Diminishing Effects of Quarantines on the Spread of COVID-19 "	4-Feb-21	CID Faculty Working	We convert the effect in Figure 4 after 90 days (log difference -1.16 of a standard deviation change) to deaths per million per stringency following footnote 3 (the footnote says "weekly deaths," but we believe this should be "daily deaths"), so the effect is $e^{-1.16} - 1 = -0.69$ decline in daily deaths per million per SD. We convert to total effect by multiplying with 90 days and "per point" by dividing with $SD = 22.3$ (corresponding to the SD for the 147 countries with data before March 19, 2020 - using all data yields similar results) yielding -2.77 deaths per million per stringency point. The common estimate is the average effect in Europe and United States respectively calculated as (Actual COVID-19 mortality) / (COVID-19 mortality with recommendation policy) -1, where (COVID-19 mortality with recommendation policy) is calculated as ((Actual COVID-19 mortality) - Estimate x Difference in stringency x population). Stringencies in Europe and United States are equal to the average stringency from March 16th to April 15th 2020 (76 and 74 respectively) and the stringency for the policy based solely on recommendations is 44 following Hale et al. (2020).
Guo et al. (2021); "Mitigation Interventions in the United States: An Exploratory Investigation of Determinants and Impacts"	21-Sep-20	Research on Social Work Practice	We use estimates for "Proportion of Cumulative Deaths Over the Population" (per 10,000) in Table 3. We interpret this number as the change in cumulative deaths over the population in percent and is therefore the same as our common estimate.
Hale et al. (2020); "Global assessment of the relationship between government response measures and COVID-19 deaths"	6-Jul-20	medRxiv	The study is not included in the meta-analysis, as it looks at the effect of NPIs on growth rates and does not include an estimate of the effect on total mortality. They ascertain that "sustained over three months, this would correspond to a cumulative number of deaths 30% lower," however this is not a counterfactual estimate and three months goes beyond the period they have data for.
Hunter et al. (2021); "Impact of non-pharmaceutical interventions against COVID-19 in Europe: A quasi-experimental non-equivalent group and time-series"	15-Jul-21	Eurosurveillance	The study is not included in the meta-analysis, as they report the effect of NPIs in incident risk ratio which are not easily converted to relative effects.

1. Study (Author & title)	2. Date Published	3. Journal	4. Comments regarding meta-analysis
Langeland et al. (2021); "The Effect of State Level COVID-19 Stay-at-Home Orders on Death Rates"	5-Mar-21	Culture & Crisis Conference	The study is not included in the meta-analysis, as it looks at the effect of NPIs on odds-ratios and does not include an estimate of the effect on total mortality.
Leffler et al. (2020); "Association of country-wide coronavirus mortality with demographics, testing, lockdowns, and public wearing of masks"	26-Oct-20	ASTMH	Their "mask recommendation" includes some countries, where masks were mandated and may (partially) capture the effect of mask mandates. However, the authors' focus is on recommendation, so we do interpret their result as a voluntary effect - not an effect of mask mandate. Using estimates from Table 2 and assuming NPIs were implemented March 15 (8 weeks in total by end of study period), common estimates are calculated as $8 \hat{est} - 1$.
Mccafferty and Ashley (2021); "Covid-19 Social Distancing Interventions by Statutory Mandate and Their Observational Correlation to Mortality in the United States and Europe"	27-Apr-21	Pragmatic and Observational Research	The study is not included in the meta-analysis, as it looks at the effect of NPIs on peak mortality and does not include an estimate of the effect on total mortality.
Pan et al. (2020); "Covid-19: Effectiveness of non-pharmaceutical interventions in the united states before phased removal of social distancing protections varies by region"	20-Aug-20	medRxiv	The study is not included in the meta-analysis, as the cluster the NPIs (e.g. SIPO, mask mandata amd travel restricions are clustered in Level 4).
Pincombe et al. (2021); "The effectiveness of national-level containment and closure policies across income levels during the COVID-19 pandemic: an analysis of 113 countries"	4-May-21	Health Policy and Planning	Policy implementations were assigned according to the first day that a country received a policy stringency rating above 0 in the OxCGRT stay-at-home measure. As the value 1 is a recommendation "recommend not leaving house," we cannot distinguish recommendations from mandates, and, thus, the study is not included in the meta-analysis.
Sears et al. (2020); "Are we #stayinghome to Flatten the Curve?"	6-Aug-20	medRxiv	Find that SIPOs lower mortality by 29-35%. We use the average (32%) as our common estimate. Common standard errors are calculated based on estimates and standard errors from (Table 4) assuming they are linearly related to estimates.
Shiva and Molana (2021); "The Luxury of Lockdown"	9-Apr-21	The European Journal of Develpement Research	The estimate with 8 weeks lag is insignificant, and preferable given our empirical strategy. However, they use the 4-week lag when elaborating the model to differentiate between high- and low-income countries, so the 4-week lag estimate for rich countries is used in our meta-analysis. Common estimate is calculated as the average of the effect in Europe and United States, where the effect for each is calculated as (policy stringency - recommendation stringency) x estimate.
Spiegel and Tookes (2021); "Business restrictions and Covid-19 fatalities"	18-Jun-21	The Review of Financial Studies	We use weighted average of estimates for Table 4, 6, and 9. Since authors state that they place more weight on the findings in Table 9, Table 9 weights by 50% while Table 4 and 6 weights by 25%. We estimate the effect on total mortality from effect on growth rates based on authors calculation showing that estimates of -0.049 and -0.060 reduces new deaths by 12.5% 15.3% respectively. We use the same relative factor on other estimates.
Stockenhuber (2020); "Did We Respond Quickly Enough? How Policy-Implementation Speed in Response to COVID-19 Affects the Number of Fatal Cases in Europe"	10-Nov-20	World Medical & Health Policy	When calculating arithmetic average / median, the study is included as 0%, because estimates in Table 6 are insignificant and signs of estimates are mixed (higher strictness can cause both fewer and more deaths). We don't calculate common standard errors.
Stokes et al. (2020); "The relative effects of non-pharmaceutical interventions on early Covid-19 mortality: natural experiment in 130 countries"	6-Oct-20	medRxiv	We use estimates from regression on strictness alone (Right panel in Table "Regression results, policy strictness. Baseline is "policy not introduced within policy analysis period" in "Additional file"). We use the average of 24 and 38 days from model 5. There are 23 relevant estimates in total (they analyze all levels within the eight NPI measures in the OxCGRT stringency index). We calculate the effect of each NPI (e.g. closing schools) as the average effect in all of U.S./Europe. This is done by calculating the effect for each state/country based on the maximum level for each measure between Mar 16 and Apr 15 (e.g. if all schools in a state/country are required to close (school closing level 3) the relevant estimate for that state/level is -0.031 (average of -0.464 and 0.402). We assume all NPIs are effective for 54 days (from March 15 to June 1 minus 24 days to reach full effect). Standard errors are converted to common standard errors following the same process (this approach is unique for Stokes, as our general approach is not possible).

1. Study (Author & title)	2. Date Published	3. Journal	4. Comments regarding meta-analysis
Toya and Skidmore (2020); "A Cross-Country Analysis of the Determinants of Covid-19 Fatalities"	1-Apr-20	CESifo Working Papers	It is unclear how they define "lockdown." They write that "many countries [...] imposed lockdowns of varying degrees, some imposing mandatory nationwide lockdowns, restricting economic and social activity deemed to be non-essential," and since all European countries and all states in the U.S. imposed restrictions on economic (closing unessential businesses) and/or social (limiting large gatherings) activity, we interpret this as all European countries and all U.S. states had mandatory nationwide lockdowns. The effect of recommended lockdowns is set to zero in the meta-analysis, as only one country was in this lockdown category (i.e. too few observations, cf. eligibility criteria). The estimate for complete travel closure is -0.226 COVID-deaths per 100,000. Hence, if all of Europe imposed complete travel closure, the total effect would be $-0.266 * 748 \text{ million (population)} * 10 (100,000/1,000,000)$ equal to 1,690 averted COVID-19 deaths. However, according to OxCGRT-data European countries only had complete travel bans (Level 4: "Ban on all regions or total border closure") in 11% of the time between March 16 and April 15, 2020. So the total effect is $1,690 * 11\% = 194$ averted deaths. During the first wave 188,000 deaths in Europe was related to COVID-19 (by June 30, 2020), so the total effect is approximated to -0.1% in Europe and, following the same logic, 0% in U.S., where no states closed their borders completely. We use the average, -0.05%, in the meta-analysis. The estimate for mandatory national lockdown is 0.166 (>0) COVID-deaths per 100,000. Since all European countries (and U.S. states) imposed lockdowns, the total effect is 1,241 (553) extra COVID-19 deaths corresponding to 0.7% (0.4%). We use the average of Europe and the U.S., 0.5%, in the meta-analysis. Calculations of the effect of "Mandatory national lockdown" follow the same logic, but we assume 100% of Europe and United States have had "Mandatory national lockdown."
Tsai et al. (2021); "Coronavirus Disease 2019 (COVID-19) Transmission in the United States Before Versus After Relaxation of Statewide Social Distancing Measures"	3-Oct-20	Oxford academic	The study is not included in the meta-analysis, as they report the effect of NPIs on Rt which are not easily converted to relative effects.

Subject: Comments for the Immunizations Technical Advisory Group

External Email

Board members,

In regards to the upcoming TAG meeting considering COVID-19 for inclusion in chapter 246-105 WAC, I would like to provide a comment I sincerely hope you consider. I am a concerned mother with two young children. My concerns stated here are shared by my many friends and family members who are also parents.

According to the AAP, 12 million children have tested positive for COVID-19 since the beginning of the pandemic. For millions of children with natural immunity their risk of injury from COVID-19 vaccination outweigh the benefits.

We have absolutely no long term data on the teratogenic, neurological etc. effects this could have on our children. These vaccines do not prevent transmission and although they are shown to prevent severe disease and hospitalization (of which children are at extremely low risk), they do not offer robust protection against acquiring infection with the currently circulating Omicron variant. We do not know how they will perform with future variants.

There is an increased risk of myocarditis after covid vaccination which is seen on the FDA and CDC safety surveillance systems.

A Kaiser Permanente study found that for every million children vaccinated there was a myopericarditis rate of 208 cases.

Dr. Fauci recently explained that pediatric hospitalization rates are exaggerated by the detection of mild or asymptomatic infection secondary to universal screening. Additionally, a Stanford University study found that 45% of pediatric COVID-19 hospital admissions were unlikely to have been caused by SARS-CoV-2.

It is even harder to justify vaccinating our children when the Omicron variant is

associated with less severe disease and lower hospitalization rates.

Other countries have come to the wise decision against recommending covid shots for children (Sweden); and yet, this board is considering requiring it.

The Omicron variant, millions of children with natural immunity, the increased risk of myocarditis and no long term data on safety or efficacy in children makes a decision on this matter uncomplicated. Please do the responsible thing and leave this decision to the parents. It is not okay to just say parents can file for an exemption. There will be a multitude of parents who pull their children from public/private schools if this becomes a requirement. This is about the principle of letting parents decide, given the current and constantly changing information, what is best for their child.

Respectfully,

Marneye Driesen

External Email

As a concerned Washington resident, a patient educator and informed-consent advocate, and a parent of school-age children, I stand opposed to Covid vaccine mandates for children and implore you to oppose them as well.

Your own meeting notes admit there is no evidence regarding the effectiveness of vaccines in K-12 settings. Children are at extremely low risk from Covid, whereas the vaccines are still in the testing phase, and long-term side effects may not be known for many years. The evidence that IS available suggests that boys and young men may even be at more risk from vaccine-induced myocarditis than from Covid-19 itself. Mandates have the potential to cause MORE injury and morbidity to children than they prevent.

Parents care for their children's welfare far more than any third party ever could, and those who are concerned about their children's risk from Covid have had ample opportunity to have them vaccinated. At-risk teachers have also had ample opportunity to take advantage of vaccination to mitigate their risk. From this point on, informed-choice decisions about vaccination of children should be left to families.

I stridently oppose Covid-19 vaccine mandates for children and strongly urge you to do the same. It is not worth infringing upon families' medical autonomy for an intervention with questionable evidence supporting its efficacy.

Thank you,

Megan Minnick

WA State Board of Health,

I strongly oppose the discussion of covid-19 vaccine mandate for our children. Clearly this vaccine does not do its job as you see the up tick in cases in fully vaccinated individuals. The long term effects of this are unknown and until the full data comes out and time has passed this should not be required it should be a choice.

This is not okay. Let the parents decide what is best for their child. Children are not at high risk and as we have been seeing the vaccine does not do what it was set to do.

Subject: Opposed to adding Covid "vaccines" to WAC 246-105

External Email

Dear members of the Washington State Board of Health,

In reference to your TAG meeting February 10, I want to register my vehement opposition to including the Covid-19 "vaccines" to the list of mandatory vaccines for children attending school.

A) Children are not dying on a grand scale from Covid. They do not need a "vaccine" against the disease. Especially one which releases large amounts of spike protein into their bodies.

B) The vaccines are still in the experimental stage, "Emergency Use Authorization" only. The adult population has been serving as guinea pigs. We've seen the inefficacy of these injections in the adult population, and do not need to inject these dangerous mRNA substances into the young population.

C) The pharmaceutical companies know that if the vaccines are approved or mandated for widespread use in children, they can move to being non-EUA by the FDA without threat of legal recrimination for damages related to these injections. Of course, Big Pharma is pushing for children to receive these injections!

Please beware of playing with the lives of our next generation in this way.

Sincerely,
Nancy Grunewald

Dear Board members,
As no long term testing has been done on these vaccines and there is plenty of evidence already of severe side effects and deaths from them, I think there is no need at all to add this to the list of required vaccines. In addition, school aged children do not contract Covid and suffer very little if they do. The risk assessment says the vaccines don't provide enough benefit to warrant them.

External Email

Dear Ms. Hisaw,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

I don't know if you've received this yesterday or not.

Corrupted in WA,

I think we've all had enough of this "Rules for Thee, but not for me..."

When are you going to be giving up on this never-ending covid nonsense? Let our children breathe, get sick, get better/healthier, move on with their lives?

Are you also sick of the hypocrites at ALL levels? I am seriously glad that we will be pulling our children out of WA schools, moving to a free state and will letting them breathe. Very soon, expect to see our withdrawal letters being handed to the schools as they do not fight with us against this tyranny.

I want to send my kids to school without masks but they don't want to wear the 'school/medical masks'. I say, if they give you one, put it in your pocket, have them call me. I'm awaiting a call. No more!

Josh Daugherty

While the Unity Project has been laser focused on stopping the vaccine mandate for K-12 students bringing forth scientific experts and resources, we must widen our fight to include these tyrannical and illogical mask mandates.

There are groups across California and other states that have done amazing work fighting these mask mandates and we are with you when we say Enough is Enough!

Our children are wearing masks for 6-8 hours a day while Governor Newsom, other public officials and celebrities parade around maskless in a California venue that requires them. A venue with 70,000 people, in a state that is still "under emergency". This is not only hypocrisy in the highest degree, it's a blatant slap in the face and, in our opinion, the green light to stop sending your kids to school in masks if you haven't already.

Despite Newsom's poor attempt at an explanation for not wearing a mask, it's time to email and call your schools, principals, teachers and school board members letting them know you will no longer comply.

- * Send your kids to school without a mask, tell them they are heroes for standing up
- * Talk to other parents and get a group together, show power in numbers
- * Reach out to school leaders, let them know your child won't be wearing a mask
- * You can use the verbiage and links below that point to empirical evidence of the efficacy and harm that come from masks
- * Share your success stories, you will be an inspiration to others!

Please see the links below illustrating, with empirical evidence, that masks are not only ineffective (as stated by Fauci in the attached video), they are dangerous. It is time we take action. Stop sending your kids to school with masks on. Do not comply. The only way we end this mask mandate is by uniting and fighting these mandates together. Find your group of parents at your schools, look on our strategic partner page for groups near you and join with them. Protest the mask mandates together. Email and call your principals and school board members.

There is NO LAW that requires the masking of our children. There is not even a mask mandate. There is only a "guidance" from the CDPH which is linked herein.

Those of us that want/need them gone are in the vast majority. They only serve to prevent the infected person from transmitting their illness (with an N95 only) but such people/children should be kept home anyway. Our kids are suffering needlessly.

To Whom It May Concern-

I'm reaching out to see who and/or how I can find out more about plans for future mask mandates for K-12 and also the potential for vaccine mandates. I understand a Technical Advisory Committee has been formed regarding consideration of vaccine mandates, but I don't know what is going on on the mask facet.

That said, what is the best way for me to voice my concerns (which are strongly opposed to mandates and believe this should all be voluntary) and/or stay up to date with these items in terms of Department of Health plans/discussions/actions?

Thank you in advance,

Keith Kirby

Please enter your comments or questions in the space provided below:

Caregivers & Parents Survey: COVID-19 Vaccine as a School Requirement Under state law (RCW 28A.210.140), the State Board of Health (Board) has the authority to create immunization requirements for child care and school entry. Since 2006, the Board has relied on multi-disciplinary technical advisory groups (TAG) to review vaccines against nine criteria to recommend to the Board whether an immunization should be added to the list of requirements. The Board recently directed its staff to work with the Department of Health to begin the process to collect the information necessary to convene a TAG to evaluate COVID-19 vaccine. The TAG will utilize the 9-criteria framework established by the Board to assess and evaluate the COVID-19 vaccine as a requirement for child care and school entry and provide a recommendation to the Board. As the preparation to convene the TAG is underway, Board and Department of Health staff would like your insight and feedback regarding the burden an additional school immunization requirement may create for parents, families, and caregivers. We recognize that getting kids vaccinated can include transporting children to medical appointments, taking time off work for those medical appointments, maintaining the child's immunization records, etc. Vaccine requirements for child care and school entry may also impact the health decisions that parents, families, and caregivers make on their child's behalf because parents must, at the very least, take the required vaccine into account. Since parents, families, and caregivers are often involved in obtaining vaccines for children, your feedback on this topic is essential. Knowing that adding COVID-19 vaccine as a requirement for school entry will impact families across the state, we are asking for your input on the barriers you may face to getting your kids vaccinated and how burdensome a COVID-19 vaccine requirement may be for you and your family. Feedback provided by survey respondents will be presented to the TAG for their consideration during review and discussion. However, the purpose of the TAG is to evaluate a vaccine against the established criteria to develop and provide a recommendation to the Board. The recommendation is then presented to the Board at one of its regularly scheduled meetings for consideration. The Board, at their discretion, may or may not approve the TAG's recommendation.

1.Organization or Community Affiliation La Center School District
2.Would adding COVID-19 vaccine as a requirement for school entry make you more or less likely to get your child vaccinated?
3.How burdensome would an additional immunization requirement for school entry be for you and your family?
4.What are some of the barriers you face to getting your child vaccinated against COVID-19? I will NEVER give my children this vaccine. It is made with aborted fetal cell lines. I absolutely object to this 100%.
5.What are some of the benefits you see to vaccination? Do the possible benefits of vaccinating your child against COVID-19 reduce the impact of identified

burdens of obtaining the vaccine? None. Children have a very powerful immune response and the virus is not dangerous to them. NO. 6. Do you believe adding COVID-19 vaccine as an immunization requirement for school entry is reasonable? Why or why not? ABSOLUTELY NOT REASONABLE. This vaccine does more harm than good to children. We will not accept the vaccine. Here is the note we got when attempting to submit this survey to you: "The maximum number of people have already responded to this form." But we still want you to have our responses.

Judging by the agenda outline, it appears the TAG have already made up their minds. There are two "experts" in attendance that will support the TAG preordained decision. They are, after all, doctors and "experts". The same bunch that have recommended lockdowns and vaccinations that don't work.

It is being proven now. Today. A recent Johns Hopkins study found lockdowns and masks have done more harm than good, especially to children who have a 99.98% survivability rate from covid infection.

The vaccines and boosters are not proving effective long-term. The long term side effects of the vaccines in children are also unknown.

Where are the doctors who are against the experimental vaccine being given to kids? Why aren't they being asked to give testimony? Why aren't they being heard? Because they might give you real information, not the government provided narrative that can't be disputed or held up for examination.

Holding a vote when the outcome has been previously decided is disingenuous at best. Not inviting opposing viewpoints and information is dangerous and unscientific. Allowing the public to only see or hear the meeting but provide no feedback is shameful. These are our children, not yours. We make the decisions on their health and safety. You "experts" have had free reign for 2 years and it is now worse, not better.

Leave our kids alone. Let the parents and their children's doctors make the decision to vaccinate or not.

Stop doing more damage. Vote no and allow the parents to decide what's best for their children.

Sincerely,
John Pavlick
Concerned and frustrated parent.

Dear SBOH members,

Please provide your data and facts that you have stating that this vaccine PREVENTS the disease and REDUCES the risk of person to person transmission that is stated in criteria's 5 and 6 at the bottom of this email.

The CDC even states that the vaccine does not prevent people from getting the disease or reduces transmission. It may lessen some people's' symptoms and/or may keep some people out of the hospital if they contract COVID, but it is not necessary for children who are basically unaffected by either. This vaccine has known side effects and is not a one size fit all. Also, take note that the vaccine is for the original variant and not for the current or future variants.

Where there are risks, there should be a choice. I hope you take this into consideration during the meeting. America is the land of the free and parents should have the freedom to make medical decisions for their children.

Thank you,
Jennifer Edington

I am writing to comment about my concern that the DOH is considering adding the COVID-19 vaccination to the list of shots for school attendance. There is currently no published literature on pediatric COVID-19 vaccine effectiveness in the K-12 school setting. I do not think this is a safe idea for our children. If people want to get their children vaccinated with a new vaccine that has no research in young children they can do that but to make it a requirement to be in school is forcing people to use what is an emergency only basically experimental drug for that age group. Please consider that this is not in the best interests of the children at this time.

Thanks for your time and hard work.

Sincerely,
Heidi Ochsner

Dear State Board of Health,

Please, fix the current policy to reflect the updated science and remove the responses parents get from local school boards and superintendents that they are just following your guidelines. You are not elected officials and your inability to adjust policy to current science has done damage to this state and its children and continues to do more damage.

Please find your integrity to do your job and stop this draconian policy making that is causing far more harm than good and update your policy to reflect science and new information.

Denmark a similar size population to the State of Washington announced effective February 1, 2022, all restrictions are ending in the country. Funny such a small country has better genomic sequencing than the United States. So even with a growth in Omicron BA. 2 they are eliminating all Covid mandates and requirements.

When will Washington join the rest of the world and move forward from the Pandemic to an Endemic as vaccines do not stop the spread nor do they stop a person from getting multiple variants over time nor are they better at reducing hazard risk than natural immunity.

Please revise your policies and do what is right for the children of Washington as your constituents expect. Stop the pandemic of bureaucratic fear mongering and the US Hospitalization Trends is from your January 12, 2022, meeting presented by your Chief Science Officer. Kids have never been at risk and your own data presentation sourced from the CDC shows that.

Sincerely,

Tim Caldwell

Subject: RE: Covid-19 Guidelines and Actual Hospitalizations of Youth.

Dear Mr. Caldwell,

Thank you for your email. We appreciate the input from community members, parents, staff, and students. It is important to note that although there may be differences in the level of public support for the CDC or other public health agencies, K-12 public and private schools in our state are required to follow the K-12 Covid-19 Requirements <<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.doh.wa.gov%2FPortals%2F105-K12Schools2021-2022.pdf&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C06fde7ca309242541bc808d9e50229c9%7C11d0>> published by the Washington State Department of Health (DOH) in order to continue to provide in-person instruction. While we have advocated for changes in the guidance over the past many months, the mandate to follow the guidelines remains in place at this time. The most recent update was published January 26, 2022.

Sincerely,

John Polm, Ed.D.

Subject: Covid-19 Guidelines and Actual Hospitalizations of Youth.

Caution: This email came from outside the Puyallup School District. Do not reply, click any link or open attachments unless you have verified the sender.

Dear Superintendent Polm and Puyallup School Board Members,

Please see the attached documents including the letter to the CDC from Republican members of congress showing how little science is involved in the CDC policies. Additionally, from the CDC you will find attached a document showing actual hospitalizations by age group and as you can see children are in the bottom orange line. So, at no time was there a large group of children in the hospital due to the pandemic and your teachers, the Teachers' Union and others have promoted a narrative of fear instead of one based on actual data. Even during the less severe and more contagious Omicron variant there has been at most 4,400 children in hospitals nationwide or .008 percent of the 56 million school age children in America. In fact, according to the CDC data since August of 2020 a total of 85,369 people under the age of 18 with confirmed cases of Covid-19 have been admitted to hospital or .15% of all school age children under the age of 18 in the United States. There have been less than 883 deaths for the 18 and under age group in the United States based on CDC data through 1/22/2022 and 603 for school age children 5 to 18 years old out of 56 million school age children nationwide or expressed as a percentage of school age children .001%. Covid-19 is and never was a leading cause of death to youth and fear and stupidity have driven this response and bad policy. Sweden has decided not to vaccinate any school age children as they have an infinitesimal small risk of hospitalization or death.

You will also notice that a recent CDC study of Covid-19 Cases and Hospitalizations by Covid-19 Vaccination Status and Previous Covid-19 Diagnosis—California and New York, May-November 2021 showing the vaccine timeline and results that directly indicates graphically that Unvaccinated with previous Covid-19 diagnosis have less hazard rate than vaccinated, no previous Covid-19 diagnosis. Also Noted that by early October, persons who survived a previous infection had lower case rates than persons who were vaccinated alone. Why our leaders have chosen to ignore 100 years of the science of natural immunity is beyond me. Apparently making money at all costs was more important than practicing sound medicine and public health policy.

To summarize you are following guidelines that do not match science or studies that have debunked as deeply flawed and bad science such as is the situation with the Arizona study that the CDC keeps using to justify a mask mandate for children. At what point do

you and the board and the school district recognize the damage you are doing. Your policies are not backed by science. Maybe you want to start teaching the kids that the earth is flat again, leaches and bloodletting are modern medical procedures, or the sun rotates around the earth. Science is about replacing poor scientific theory with new conclusions backed by sound science and data. The time must be now for the removal of mandates that are not grounded in anything scientific, and you are proving why our district has a 38% rating in the science area when people cannot understand when one theory is debunked because it had no grounding in sound science. Below you will also find the Atlantic article that demonstrates the poor science the CDC masking policy is based on, and you are forcing on our children with little discernible benefit. Masks should be at best optional and surely not mandated as they do far more damage to kids and especially those in early elementary school learning to speak and read.

Summary

What is already known about this topic?

Data are limited regarding the risks for SARS-CoV-2 infection and hospitalization after COVID-19 vaccination and previous infection.

What is added by this report?

During May–November 2021, case and hospitalization rates were highest among persons who were unvaccinated without a previous diagnosis. Before Delta became the predominant variant in June, case rates were higher among persons who survived a previous infection than persons who were vaccinated alone. By early October, persons who survived a previous infection had lower case rates than persons who were vaccinated alone.

What are the implications for public health practice?

Although the epidemiology of COVID-19 might change as new variants emerge, vaccination remains the safest strategy for averting future SARS-CoV-2 infections, hospitalizations, long-term sequelae, and death. Primary vaccination, additional doses, and booster doses are recommended for all eligible persons. Additional future recommendations for vaccine doses might be warranted as the virus and immunity levels change.

By November 30, 2021, approximately 130,781 COVID-19–associated deaths, one in six of all U.S. deaths from COVID-19, had occurred in California and New York.* COVID-19 vaccination protects against infection with SARS-CoV-2 (the virus that causes COVID-19), associated severe illness, and death (1,2); among those who survive, previous SARS-CoV-2 infection also confers protection against severe outcomes in the event of reinfection (3,4). The relative magnitude and duration of infection- and vaccine-derived protection, alone and together, can guide public health planning and epidemic forecasting. To examine the impact of primary COVID-19 vaccination and previous SARS-CoV-2 infection on COVID-19 incidence and hospitalization rates, statewide testing, surveillance, and COVID-19 immunization data from California and New York (which account for 18% of the U.S. population) were analyzed. Four cohorts of adults aged ≥18 years were considered: persons who were 1) unvaccinated with no previous laboratory-confirmed COVID-19 diagnosis, 2) vaccinated (14 days after completion of a primary COVID-19 vaccination series) with no previous COVID-19 diagnosis, 3) unvaccinated with a previous COVID-19 diagnosis, and 4) vaccinated with a previous COVID-19 diagnosis. Age-adjusted hazard rates of incident laboratory-confirmed COVID-19 cases in both states were compared among cohorts, and in California, hospitalizations during May 30–November 20, 2021, were also compared. During the study period, COVID-19 incidence in both states was highest among unvaccinated persons without a previous COVID-19 diagnosis compared with that among the other three groups. During the week beginning May 30, 2021, compared with COVID-19 case rates among unvaccinated

persons without a previous COVID-19 diagnosis, COVID-19 case rates were 19.9-fold (California) and 18.4-fold (New York) lower among vaccinated persons without a previous diagnosis; 7.2-fold (California) and 9.9-fold lower (New York) among unvaccinated persons with a previous COVID-19 diagnosis; and 9.6-fold (California) and 8.5-fold lower (New York) among vaccinated persons with a previous COVID-19 diagnosis. During the same period, compared with hospitalization rates among unvaccinated persons without a previous COVID-19 diagnosis, hospitalization rates in California followed a similar pattern. These relationships changed after the SARS-CoV-2 Delta variant became predominant (i.e., accounted for >50% of sequenced isolates) in late June and July. By the week beginning October 3, compared with COVID-19 case rates among unvaccinated persons without a previous COVID-19 diagnosis, case rates among vaccinated persons without a previous COVID-19 diagnosis were 6.2-fold (California) and 4.5-fold (New York) lower; rates were substantially lower among both groups with previous COVID-19 diagnoses, including 29.0-fold (California) and 14.7-fold lower (New York) among unvaccinated persons with a previous diagnosis, and 32.5-fold (California) and 19.8-fold lower (New York) among vaccinated persons with a previous diagnosis of COVID-19. During the same period, compared with hospitalization rates among unvaccinated persons without a previous COVID-19 diagnosis, hospitalization rates in California followed a similar pattern. These results demonstrate that vaccination protects against COVID-19 and related hospitalization, and that surviving a previous infection protects against a reinfection and related hospitalization. Importantly, infection-derived protection was higher after the Delta variant became predominant, a time when vaccine-induced immunity for many persons declined because of immune evasion and immunologic waning (2,5,6). Similar cohort data accounting for booster doses needs to be assessed, as new variants, including Omicron, circulate. Although the epidemiology of COVID-19 might change with the emergence of new variants, vaccination remains the safest strategy to prevent SARS-CoV-2 infections and associated complications; all eligible persons should be up to date with COVID-19 vaccination. Additional recommendations for vaccine doses might be warranted in the future as the virus and immunity levels change.

Four cohorts of persons aged ≥ 18 years were assembled via linkages of records from electronic laboratory reporting databases and state-specific immunization information systems.¹ Persons were classified based on whether they had had a laboratory-confirmed SARS-CoV-2 infection by March 1, 2021 (i.e., previous COVID-19 diagnosis)⁵; had received at least the primary COVID-19 vaccination series⁶ by May 16, 2021; had a previous COVID-19 diagnosis and were fully vaccinated^{**}; or had neither received a previous COVID-19 diagnosis by March 1 nor received a first COVID-19 vaccine dose by the end of the analysis period. The size of the unvaccinated group without a previous diagnosis was derived by subtracting the observed groups from U.S. Census estimates.⁷ To maintain each defined cohort, persons who received a COVID-19 diagnosis during March 1–May 30, 2021, or who died before May 30, 2021, were excluded (to maintain eligibility for incident cases for all cohorts on May 30, 2021),^{8,9} as were persons who received a first vaccine dose during May 30–November 20, 2021. During May 30–November 20, 2021, incident cases were defined using a positive nucleic acid amplification test (NAAT) result from the California COVID-19 Reporting System (CCRS) or a positive NAAT or antigen test result from the New York Electronic Clinical Laboratory Reporting System. In California, person-level hospitalization data from CCRS and supplementary hospitalization reports were used to identify COVID-19–associated hospitalizations. A lifetable method was used to calculate hazard rates (average daily cases during a 7-day interval or hospitalizations over a 14-day interval), hazard ratios, and 95% CIs for each cohort. Rates were age-adjusted to 2000 U.S. Census data using direct standardization.¹⁰ Supplementary analyses stratified case rates by timing of previous diagnoses and primary series vaccine product. SAS (version 9.4; SAS Institute) and R (version 4.0.4; The R Foundation) were used to conduct all analyses. Institutional review boards (IRBs) in both states determined this surveillance activity to be necessary for public health work, and therefore, it did not require IRB review.

Approximately three quarters of adults from California (71.2%) and New York (72.2%) included in this analysis were vaccinated and did not have a previous COVID-19 diagnosis; however, 18.0% of California residents and 18.4% of New York residents were unvaccinated with no previous COVID-19 diagnosis (Table 1). In both states, 4.5% of persons were vaccinated and had a previous COVID-19 diagnosis; 6.3% in California and 4.9% in New York were unvaccinated with a previous diagnosis. Among 1,108,600 incident COVID-19 cases in these cohorts (752,781 in California and 355,819 in New York), the median intervals from vaccination or previous COVID-19 diagnosis to incident diagnosis were slightly shorter in California (138–150 days) than in New York (162–171 days).

Before the Delta variant became predominant in each state's U.S. Department of Health and Human Services region (June 26 in Region 9 [California] and July 3 in Region 2 [New York]),^{***} the highest incidence was among unvaccinated persons without a previous COVID-19 diagnosis; during this time, case rates were relatively low among the three groups with either previous infection or vaccination and were lowest among vaccinated persons without a previous COVID-19 diagnosis (Supplementary Figure 1, <https://stacks.cdc.gov/view/cdc/113253>) (Supplementary Figure 2, <https://stacks.cdc.gov/view/cdc/113253>). During the week beginning May 30, 2021, compared with COVID-19 case rates among unvaccinated persons without a previous COVID-19 diagnosis, COVID-19 case rates were 19.9-fold (California) and 18.4-fold (New York) lower among vaccinated

persons without a previous diagnosis; rates were 7.2-fold (California) and 9.9-fold (New York) lower among unvaccinated persons with a previous COVID-19 diagnosis and 9.6-fold (California) and 8.5-fold (New York) lower among vaccinated persons with a previous COVID-19 diagnosis (Table 2).

As the Delta variant prevalence increased to >95% (97% in Region 9 and 98% in Region 2 on August 1), rates increased more rapidly among the vaccinated group with no previous COVID-19 diagnosis than among both the vaccinated and unvaccinated groups with a previous COVID-19 diagnosis (Supplementary Figure 1, <https://stacks.cdc.gov/view/cdc/113253>) (Supplementary Figure 2, <https://stacks.cdc.gov/view/cdc/113253>). For example, during the week of October 3, compared with rates among unvaccinated persons without a previous COVID-19 diagnosis, rates among vaccinated persons without a previous diagnosis were 6.2-fold lower (95% CI = 6.0–6.4) in California and 4.5-fold lower (95% CI = 4.3–4.7) in New York (Table 2). Further, rates among unvaccinated persons with a previous COVID-19 diagnosis were 29-fold lower (95% CI = 25.0–33.1) than rates among unvaccinated persons without a previous COVID-19 diagnosis in California and 14.7-fold lower (95% CI = 12.6–16.9) in New York. Rates among vaccinated persons who had had COVID-19 were 32.5-fold lower (95% CI = 27.5–37.6) than rates among unvaccinated persons without a previous COVID-19 diagnosis in California and 19.8-fold lower (95% CI = 16.2–23.5) in New York. Rates among vaccinated persons without a previous COVID-19 diagnosis were consistently higher than rates among unvaccinated persons with a history of COVID-19 (3.1-fold higher [95% CI = 2.6–3.7] in California and 1.9-fold higher [95% CI = 1.5–2.3] in New York) and rates among vaccinated persons with a history of COVID-19 (3.6-fold higher [95% CI = 2.9–4.3] in California and 2.8-fold higher [95% CI = 2.1–3.4] in New York).

COVID-19 hospitalization rates in California were always highest among unvaccinated persons without a previous COVID-19 diagnosis (Table 2) (Figure). In the pre-Delta period during June 13–June 26, for example, compared with hospitalization rates among unvaccinated persons without a previous COVID-19 diagnosis, hospitalization rates were 27.7-fold lower (95% CI = 22.4–33.0) among vaccinated persons without a previous COVID-19 diagnosis, 6.0-fold lower (95% CI = 3.3–8.7) among unvaccinated persons with a previous COVID-19 diagnosis, and 7.1-fold lower (95% CI = 4.0–10.3) among vaccinated persons with a previous COVID-19 diagnosis. However, this pattern also shifted as the Delta variant became predominant. During October 3–16, compared with hospitalization rates among unvaccinated persons without a previous COVID-19 diagnosis, hospitalization rates were 19.8-fold lower (95% CI = 18.2–21.4) among vaccinated persons without a previous COVID-19 diagnosis, 55.3-fold lower (95% CI = 27.3–83.3) among unvaccinated persons with a previous COVID-19 diagnosis, and 57.5-fold lower (95% CI = 29.2–85.8) among vaccinated persons with a previous COVID-19 diagnosis.

Among the two cohorts with a previous COVID-19 diagnosis, no consistent incidence gradient by time since the previous diagnosis was observed (Supplementary Figure 3, <https://stacks.cdc.gov/view/cdc/113253>). When the vaccinated cohorts were stratified by the vaccine product received, among vaccinated persons without a previous COVID-19 diagnosis, the highest incidences were observed among persons receiving the Janssen (Johnson & Johnson), followed by Pfizer-BioNTech, then Moderna vaccines (Supplementary Figure 4, <https://stacks.cdc.gov/view/cdc/113253>). No pattern by product was observed among vaccinated persons with a previous COVID-19 diagnosis.

Discussion

This analysis integrated laboratory testing, hospitalization surveillance, and immunization registry data in two large states during May–November 2021, before widespread circulation of the SARS-CoV-2 Omicron variant and before most persons had received additional or booster COVID-19 vaccine doses to protect against waning immunity. Rate estimates from the analysis describe different experiences stratified by COVID-19 vaccination status and previous COVID-19 diagnosis and during times when different SARS-CoV-2 variants predominated. Case rates were initially lowest among vaccinated persons without a previous COVID-19 diagnosis; however, after emergence of the Delta variant and over the course of time, incidence increased sharply in this group, but only slightly among both vaccinated and unvaccinated persons with previously diagnosed COVID-19 (6). Across the entire study period, persons with vaccine- and infection-derived immunity had much lower rates of hospitalization compared with those in unvaccinated persons. These results suggest that vaccination protects against COVID-19 and related hospitalization and that surviving a previous infection protects against a reinfection. Importantly, infection-derived protection was greater after the highly transmissible Delta variant became predominant, coinciding with early declining of vaccine-induced immunity in many persons (5). Similar data accounting for booster doses and as new variants, including Omicron, circulate will need to be assessed.

The understanding and epidemiology of COVID-19 has shifted substantially over time with the emergence and circulation of new SARS-CoV-2 variants, introduction of vaccines, and changing immunity as a result. Similar to the early period of this study, two previous U.S. studies found more protection from vaccination than from previous infection during periods before Delta predominance (3,7). As was observed in the present study after July, recent international studies have also demonstrated increased protection in persons with previous infection with or without vaccination relative to vaccination alone^{39, 595} (4). This

might be due to differential stimulation of the immune response by either exposure type.¹¹¹ Whereas French and Israeli population-based studies noted waning protection from previous infection, this was not apparent in the results from this or other large U.K. and U.S. studies^{****} (4,8). Further studies are needed to establish duration of protection from previous infection by variant type, severity, and symptomatology, including for the Omicron variant.

The findings in this report are subject to at least seven limitations. First, analyses were not stratified by time since vaccine receipt, but only by time since previous diagnosis, although earlier studies have examined waning of vaccine-induced immunity (Supplementary Figure 3, <https://stacks.cdc.gov/view/cdc/113253>) (2). Second, persons with undiagnosed infection are misclassified as having no previous COVID-19 diagnosis; however, this misclassification likely results in a conservative bias (i.e., the magnitude of difference in rates would be even larger if misclassified persons were not included among unvaccinated persons without a previous COVID-19 diagnosis). California seroprevalence data during this period indicate that the ratio of actual (presumptive) infections to diagnosed cases among adults was 2.6 (95% CI = 2.2–2.9).¹¹² Further, California only included NAAT results, whereas New York included both NAAT and antigen test results. However, antigen testing made up a smaller percentage of overall testing volume reported in California (7% of cases) compared with New York (25% of cases) during the study period. Neither state included self-tests, which are not easily reportable to public health. State-specific hazard ratios were generally comparable, although differences in rates among unvaccinated persons with a previous COVID-19 diagnosis were noteworthy. Third, potential exists for bias related to unmeasured confounding (e.g., behavioral or geographic differences in exposure risk) and uncertainty in the population size of the unvaccinated group without a previous COVID-19 diagnosis. Persons might be more or less likely to receive testing based on previous diagnosis or vaccination status; however, different trajectories between vaccinated persons with and without a previous COVID-19 diagnosis, and similar findings for cases and hospitalizations, suggest that these biases were minimal. Fourth, this analysis did not include information on the severity of initial infection and does not account for the full range of morbidity and mortality represented by the groups with previous infections. Fifth, this analysis did not ascertain receipt of additional or booster COVID-19 vaccine doses and was conducted before many persons were eligible or had received additional or booster vaccine doses, which have been shown to confer additional protection.⁵⁶⁶⁵ Sixth, some estimates lacked precision because of sample size limitations. Finally, this analysis was conducted before the emergence of the Omicron variant, for which vaccine or infection-derived immunity might be diminished.¹¹¹⁹ This study offers a surveillance data framework to help evaluate both infections in vaccinated persons and reinfections as new variants continue to emerge.

Vaccination protected against COVID-19 and related hospitalization, and surviving a previous infection protected against a reinfection and related hospitalization during periods of predominantly Alpha and Delta variant transmission, before the emergence of Omicron; evidence suggests decreased protection from both vaccine- and infection-induced immunity against Omicron infections, although additional protection with widespread receipt of booster COVID-19 vaccine doses is expected. Initial infection among unvaccinated persons increases risk for serious illness, hospitalization, long-term sequelae, and death; by November 30, 2021, approximately 130,781 residents of California and New York had died from COVID-19. Thus, vaccination remains the safest and primary strategy to prevent SARS-CoV-2 infections, associated complications, and onward transmission. Primary COVID-19 vaccination, additional doses, and booster doses are recommended by CDC's Advisory Committee on Immunization Practices to ensure that all eligible persons are up to date with COVID-19 vaccination, which provides the most robust protection against initial infection, severe illness, hospitalization, long-term sequelae, and death.^{*****} Additional recommendations for vaccine doses might be warranted in the future as the virus and immunity levels change.

[†] Statewide immunization databases in California are the California Immunization Registry, Regional Immunization Data Exchange, and San Diego Immunization Registry; the laboratory system is the California COVID Reporting System (CCRS). In New York, immunization information systems include Citywide Immunization Registry and the New York State Immunization Information System; the laboratory system is the Electronic Clinical Laboratory Reporting System (ECLRS). California data were matched between the immunization and case registries using a probabilistic algorithm with exact match for zip code and date of birth and fuzzy match on first name and last name. New York data were matched to the ECLRS with the use of a deterministic algorithm based on first name, last name, and date of birth. In California, person-level hospitalization data from CCRS and supplementary hospitalization reports were used to identify COVID-19-associated hospitalizations.

[§] For both classification into cohorts of persons with previous COVID-19 diagnoses and for measuring incident cases, laboratory-confirmed infection was defined as the receipt of a new positive SARS-CoV-2 nucleic acid amplification test (NAAT) or antigen test (both for New York and NAAT only for California) result, but not within 90 days of a previous positive result.

[¶] Fully vaccinated with the primary vaccination series is defined as receipt of a second dose of an mRNA COVID-19 vaccine (Pfizer-BioNTech or Moderna) or 1 dose of the Janssen (Johnson & Johnson) vaccine ≥ 14 days before May 30, 2021.

^{**} Because of the timing of full vaccination, the cohort definitions, and analysis timeframe, this cohort consisted nearly exclusively of persons who had previously received a laboratory-confirmed diagnosis of COVID-19 and later were fully vaccinated (California: 99.9%, New York: 99.7%), as opposed to the reverse order.

^{††} Whereas vaccinated cohorts were directly observed in the immunization information system databases, unvaccinated persons without a previous COVID-19 diagnosis were defined using U.S. Census population estimates minus the number of persons partially or fully vaccinated by December 11, 2021, and unvaccinated persons with a previous laboratory-confirmed infection before May 30, 2021. In California, the California Department of Finance population estimates were used for 2020, and the 2018 CDC National Center for Health Statistics Bridged Race file for U.S. Census population estimates were used in New York, consistent with other COVID-19 surveillance reporting.

^{§§} In California, a person-level match was performed to exclude deaths in each cohort before May 30, 2021. In New York, COVID-19 deaths were removed in aggregate from the starting number of unvaccinated persons with a previous COVID-19 diagnosis on May 30, 2021.

* Life tables estimated at 7-day intervals for cases and 14-day intervals for hospitalizations.

† Hazard ratios and 95% CIs reported in this table differ numerically from presentation of corresponding results in the text as “X-fold lower” rates (i.e., a hazard rate of 1.0 is zero-fold lower). For example, a hazard ratio of 20.9 (95% CI = 18.9–22.9) for those “Unvaccinated–no previous COVID-19 diagnosis” versus “Vaccinated, no previous COVID-19 diagnosis” is equivalent to a 19.9-fold lower (95% CI = 17.9–21.9) rate for those “Vaccinated, no previous COVID-19 diagnosis” relative to those “Unvaccinated, no previous COVID-19 diagnosis.”

FIGURE. Incident laboratory-confirmed COVID-19-associated hospitalizations among immunologic cohorts defined by vaccination and previous diagnosis histories — California, May 30–November 13, 2021^{*,†}

Top
Return

* The SARS-CoV-2 Delta variant exceeded 50% of sequences in U.S. Department of Health and Human Services Region 9 (containing California) during the week of June 26. <https://covid.cdc.gov/covid-data-tracker/#variant-proportions>

† Estimated hazard rate is laboratory-confirmed COVID-19-associated hospitalizations per 100,000 person-days visualized at midpoint of each reporting interval.

Dear Washington State Board of Health,

Our state government should NOT be mandating Covid vaccines on our children. Children are at extremely low risk for Covid and these medical decisions should be left in the hands of parents.

Sincerely,

The Citizens of Washington State

Hello, Washington State Board of Health,

I am writing to you to request you not to put the Covid-19 Vaccination as a requirement for children to go to school in Washington State. You know that what you are requiring is against the constitution and against science. You know you are pushing this is against people's will. You know the Covid-19 vaccine is not a true vaccine and it has caused many injuries in young people and killed many. And you know that you are still pushing it is for your own benefit!!!! The blood will be on your hands if you continue participating in this evil.

The Right to Informed Consent is Meaningless Without the Right to Refuse Any Medical Intervention, Including Mandated Vaccination. Government Agents and those Acting Under Color of Law are Forbidden by Long-Standing National and International Law from Coercing Vaccination. Furthermore, this includes mask mandates and PCR testing. Children under the age of eighteen years of age need a parent's signature on any and all documents that deal with medical testing and this includes PCR testing in school.

<mailto:mzee636@gmail.com> > wrote:

The oath you took to uphold the laws includes these laws.

Requirements for vaccinations should never include an experimental gene altering injection.

We now know that these COVID injections do a great deal of harm to children.
Can you live with that on your conscience?

18 USC 241: Conspiracy against rights:

If two or more persons conspire to injure, oppress, threaten, or intimidate any person in any State, Territory, Commonwealth, Possession, or District in the free exercise or enjoyment of any right or privilege secured to him by the Constitution or laws of the United States, or because of his having so exercised the same; or

If two or more persons go in disguise on the highway, or on the premises of another, with intent to prevent or hinder his free exercise or enjoyment of any right or privilege so secured-

They shall be fined under this title or imprisoned not more than ten years, or both; and if death results from the acts committed in violation of this section or if such acts include kidnapping or an attempt to kidnap, aggravated sexual abuse or an attempt to commit aggravated sexual abuse, or an attempt to kill, they shall be fined under this title or imprisoned for any term of years or for life, or both, or may be sentenced to death.

18 USC 242: Deprivation of rights under color of law:

Whoever, under color of any law, statute, ordinance, regulation, or custom, willfully subjects any person in any State, Territory, Commonwealth, Possession, or District to the deprivation of any rights, privileges, or immunities secured or protected by the Constitution or laws of the United States, or to different punishments, pains, or penalties, on account of such person being an alien, or by reason of his color, or race, than are prescribed for the punishment of citizens, shall be fined under this title or imprisoned not more than one year, or both; and if bodily injury results from the acts committed in violation of this section or if such acts include the use, attempted use, or threatened use of a dangerous weapon, explosives, or fire, shall be fined under this title or imprisoned not more than ten years, or both; and if death results from the acts committed in violation of this section or if such acts include kidnapping or an attempt to kidnap, aggravated sexual abuse, or an attempt to commit aggravated sexual abuse, or an attempt to kill, shall be fined under this title, or imprisoned for any term of years or for life, or both, or may be sentenced to death.

Subject: COVID related restrictions and requirements for public school students

External Email

Hello,

I am writing to you not as a parent or a student in the Washington state public schools, but as someone who recently-ish (5 years ago) graduated from Interlake high school in Bellevue. I find the notion of requiring COVID vaccinations to participate in the public school system in Washington state deeply disturbing for the following reasons:

1. Students in the public school system are at the lowest risk of suffering due to COVID related symptoms. Rather, the greatest risk they face is an epidemic of mental health concerns, isolation, and suicide. Requiring a vaccination that is ineffective in preventing the transmission or contraction of COVID will only further isolate many students already at risk of the aforementioned health concerns.
2. The COVID vaccination is ineffective in preventing the transmission or contraction of COVID. While some symptoms may be reduced due to the vaccination, the vaccine does not serve to prevent the virus from spreading. As such, it is irresponsible to mandate a vaccine on students when the long term impacts of said vaccine are unknown. This is particularly true considering that students in the public schools are among the least at risk of serious complications due to COVID.

I hope that you will consider the views of concerned citizens (whom you govern with the consent of) as you discuss and strategize in how to move forward with public health in Washington State.

Cheers,

David

In response to your clarification for the meeting tomorrow, January 12, 2021 and subsequent meetings regarding vaccines for children:

There is no justification to mandate the covid vaccine for children age 5 and older. Nor is there a justification or need to require parents to file for an exemption. A parents' simple "no" to having their child be given the covid vaccine should close the matter. The decision and parental right to make the decision does not require your approval of an exemption. Nor does the risk to society outweigh the risk of the adverse effects of the vaccine.

I would ask the board to again review the under-reported VAERS data, increased cases of myocarditis, lack of definitive clinical trials, hidden vaccine contents, and future data. I would also remind the board this is not a "true" vaccine and only has EUA authorization which was inappropriate to begin with. Sincerely, Mary Sizer

External Email

Dear Ms. Haag,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

To: Donahoe, Kaitlyn N (SBOH) <kaitlyn.donahoe@sboh.wa.gov>
Subject: It's critical to preserve the personal/philosophical exemption

External Email

Kaitlyn,

I believe the covid-19 vaccines are more harmful to children than they are helpful and should never have been approved for kids. As a medical professional, you probably know or suspect this is true. At the very least, you know the trials did not have the statistical power needed to prove the vaccine is safe when compared to the miniscule risk to children from covid.

At the same time, the pressure to require the covid-19 vaccine in school is enormous, because not doing so appears to align yourself with people who are "anti-vax" and more generally with Republicans, which you may not be or may not wish to be known for. Requiring the vaccine for school children seems inevitable in a "blue state" and taking a stand will cause damage to your reputation and career, and maybe your income and family well-being... and it won't change anything. The governor will remove you from the Board if needed to ensure this policy is put into place.

It seems likely that you will approve the school vaccine mandate knowing it will kill a few children, and hurt a few more... and I understand why.

What I ask of you, therefore, is that you insist on keeping the personal/philosophical exemption in place for the covid-19 childhood vaccine. This will allow parents who wish to protect their children from harm to do so, without forcing us to withdraw them from school.

And make no mistake... hundreds of thousands of kids will vanish from school if you do not allow the personal/philosophical exemption. No manner of pressure or threat of punishment will force us to harm our kids knowingly, and the damage to schools,

families, and communities will be incalculable.

Please, do the less wrong thing that protects my kids, keeps them in school, and preserves your career as well. It's all I ask in these difficult times.

Thanks,

-David Rubino

External Email

I urge you to please refrain from mandating covid vaccination in WA students. Please consider the legal and ethical consequences related to mandating an experimental vaccination and the significant damage that may result from forcing children to receive an experimental drug that lacks long-term safety data and has not been extensively studied in children. I urge you to please consider the fact that Covid vaccination does not prevent infection nor prevent one from spreading the virus to others. Please consider that the record high numbers of Covid cases currently happening in our schools is clear evidence that increasing Covid vaccination rates in school age children is showing a direct positive correlation with increased covid cases in our schools.

Finally, please be cognizant of a parent's legal and ethical right to informed consent and individual autonomy regarding their child's health care. Parents should be able to choose for themselves what they feel is best for their child and should never be coerced and forced into giving their child an experimental therapeutic that lacks safety data in children and is proving to be ineffective in reducing rates of Covid-19 in our schools.

Please do not mandate Covid vaccination for children to attend school. Please refrain from making unethical, and immoral decisions to force this experimental vaccine on students.

Thank you for your consideration.

To whom it may concern,

I am a concerned parent in the state of WA. I have three children and pay taxes to the state for their education. I do not in any way approve of mandating the covid-19 vaccine in schools. My children are not in danger of dying from covid-19. They have a less than 1% chance of doing so. They have been exposed to covid on multiple occasions and have no more than a sniffle. Injecting them with a vaccine that does more harm than good to their system to fight against something that isn't a danger to them is irresponsible and dangerous. Please say no to this mandate and give the parents of this state the ultimate say in what goes into their children's bodies. We should not have to sacrifice their health for their education.

Thank you,

Lacey B.

Please enter your comments or questions in the space provided below:

Ref: Parent and Caregiver Survey. My school district, Lynden, sent out your survey to all guardians of students. I tried to submit my form response but it failed saying that the max participants had already responded. I have no doubt that my politically charged community responded with break neck speed. But I also wanted to share my perspective with your admin from someone who lives in the Lynden School District, loves my community, and votes in the minority. My household is fully vaccinated and boosted. Your survey asked why-my answer is that I believe in healthcare and prevention and reducing the likelihood of a fatal outcome and spreading it to others. Your survey asked about a vaccine requirement- my answer is no, because I still believe in the power of choice and freedom from forced vaccinations. I highly support recommendations from the experts but reject the idea of forced vaccinations in exchange for an education. I personally feel that it's irresponsible to not protect your children medically but I would not force my opinion on another family. Parents and students should be allowed to form their own decisions, while the government can offer alternative learning modules and methods-even if it's shifting to online or magnet /charter school type instruction. It's ridiculous that public education is so far behind in offering alternative methods that meet the needs of all students especially special education. LIVE streaming should be automatic and in every classroom so that students who are ill, traveling, chronically ill have equal opportunity and access to learning. I am very happy to chat with anyone about suggestions or concerns. Thank you for your time.

Subject: WSDOH is lying to you!

External Email

Before you mandate vaccines you should get a true report on the breakthrough cases.

The Washington State Department of Health is Lying to You!
Here is the Smoking Gun!

This is a somewhat detailed report. Actually it wasn't that hard to expose their lies.

They are deciding on "Vaccine Mandates" on false information and now it is criminal!

<https://jetero.wixsite.com/kitsapcountyreport/the-wsdoh-is-lying-to-you-yes-here-is>
<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fjetero.wixsite.com%2Fkitsapcountyreport/the-wsdoh-is-lying-to-you-yes-here-is&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C8890611dc6194ba9473508d9ebd68f77%7C11d0e2172>>

You can see that King County gives the actual breakthrough numbers.

99.7% of the cases recover and are naturally immune and don't need a booster! Who does that hurt? Gov and big pharma! Where do you think those billions go? Right into the pockets of big pharma and the health departments.

The vaccine does not work!

WSDOH has finally issued a report after 3 weeks and sadly it is a complete mess. They are lying on the report, and it cannot be trusted. I assume the trends of King County are representative of the state.

King County COVID Breakthrough Report!

As you can see the cases are equal with both the vaccinated and unvaccinated which makes you wonder why King County has a vaccine mandate.

Breakthrough Cases: The Fully Vaccinated that Get COVID!

King County somewhat honestly presents the breakthrough data by including the actual numbers. They still present it as comparison to the unvaccinated which gives a biased view. WSDOH data is on a different report and is marginally useful. KPHD actually manipulates the data to favor the vaccine.

You will not see this type of analysis anywhere else. It should be everywhere.
You can see the vaccine is marginally effective.

This is important information when they are mandating all be vaccinated. Do these statistics warrant a vaccine mandate?

The vaccinated are spreading and getting the virus, going to the hospital and dying at a significant rate.

The only people that are truly safe from the virus are the naturally immune and those that have been tested in the last 72 hours.

Those with one Pfizer or Moderna injection or have not waited the two weeks are not included in the fully vaccinated, yet they are included in the unvaccinated.

If someone dies of the vaccine there is no record. We need three categories for the deaths!

Week Ending 1-27-22 – 12,054 Cases 54% of the Cases

Week Ending 1-27-22 – 161 Hospitalization 43% of the Hospitalizations

2 Weeks Ending 1-27-22 – 39 Deaths 49% of the Deaths

They update it weekly!

<https://kingcounty.gov/depts/health/covid-19/data/vaccination-outcomes.aspx>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fkingcounty.gov%2Fdepts%2Fhealth%2Fdata%2Fvaccination-outcomes.aspx&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C8890611dc6194ba9473508d9ebd68f77%7>

Kitsap county has decided to revamp their breakthrough reports on the last week of the year when the breakthroughs are soaring. How convenient!

Kitsap County 52% of the cases are vaccinated.

Nov -Dec

Fully Vaccinated 1207

Unvaccinated 1116

These come from the Washington State Report Jan 5 and Jan 12 Report.

You can get the Jan 12 report here. I will send you the Jan 5 report

Both are PDFS!

To The Washington State Board of Health and the Public It Serves:(Please Post)

We the free and united people of America and the world are writing in regards to the unlawful and corrupt actions taken by the healthcare industry, bureaucrats, and media regarding COVID-19. The actions taken for nearly two years have stripped people of their rights, decimated the US Constitution, violated the principles of international law embodied in the Nuremburg Code and ignored basic and inalienable human rights. The people behind this have leveraged their privileged positions to make billions of dollars at the expense of humanity, and we are unwilling to allow this to continue.

For decades, the field of public health has researched the use of fear as a tool to manipulate people into action. The use of that tool has now been perfected and implemented against the people of the world with COVID-19. Evidence of this knowledge can be found in a CDC presentation, other DHHS materials, and in numerous academic journals. The intentional use of fear to sow hate, division, and discord is unethical, unacceptable, and must stop immediately. The reality is that COVID-19 has a 99%+ recovery rate in most of the population and approximately a 94% recovery rate in the most vulnerable. Compare this to the original SARS which had approximately a 9% case fatality rate and the original MERS which had over a 30% case fatality rate. We did not lockdown, mask, or even widely acknowledge these diseases when they were prevalent despite the fact that they had similar rates of spread to COVID-19. This fear has been used as a marketing tool to attempt to justify previously unthinkable actions by bureaucrats and public health figures around the world; the most egregious of which is the forced injection of gene therapy drugs into healthy people. Gene therapy literally alters the 1 genetic makeup of a human being and simply cannot legally, morally, or ethically be forced on anyone, ever. If the decision to alter one's own genetic makeup does not rest with the individual, then, there can be no argument that freedom is lost. Not only are the COVID "vaccines" admittedly a gene therapy, they are inarguably unsafe.

The swine flu vaccine was pulled from after just over 20 deaths, and the Chevy Volt was recently recalled over the potential for battery fires; but the Pfizer shot was given expanded authorization despite the high recovery rate from COVID-19 and the fact that Pfizer's own documents, submitted to the DHHS show that over 1200 people died in less than the first 3 months of authorization. This is nothing more than corruption. The COVID shots are also ineffective. A recent Department of Defense document stated that 71% of new cases of COVID-19 in the Medicare population are in fully vaccinated individuals and 60% of hospitalizations are in the fully vaccinated. This same document also stated that the injections are even less effective in North American Natives, Hispanics, and "Blacks" (the document apparently was unconcerned with political correctness).

If the 1 Moderna acknowledged in SEC filings that mRNA technology is a gene therapy. This has also been acknowledged in documents from Pfizer and by numerous scientists. If “vaccines” do not stop the spread, do not stop hospitalization, alter our genes, and have not even existed long enough for long term testing, why are we attempting to violate people’s inalienable rights by forcing them? The fact is that facets of our government are now moving ahead as quickly as possible with these COVID shots. We are even authorizing them in children despite the fact that people under 30 are at ZERO statistical risk of death from COVID-19. and the shots appear far more dangerous to children than the disease. Further, we are doing this with no transparency. The DHHS has done everything possible to cover up the side effects and dangers of these injections, even going so far as to request 55 years to release the documents they relied upon to authorize/approve these deadly injections.

How can informed consent be given without a true understanding of the risk? This situation is untenable and we demand that it be remedied. We the free people of this nation and world will no longer comply with mandates that fail to consider our inalienable rights. In the spirit of Martin Luther King, Gandhi, and Jesus Christ we will spread our message through peace and we will resist peacefully, but make no mistake, we WILL resist.

The accompanying presentation found at www.renz-law.com
<<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fwww.renz-law.com%2F&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Ce4665561f7e04623c4ee08d9e6e3be3b%7C>>
supplies you with additional data to demonstrate everything stated here. We now demand the following from our elected leaders, and vow to remember your actions or inaction when it comes time to vote and donate:

1. The resignation/termination of Anthony Fauci and civil/criminal investigation of his actions by a truly INDEPENDENT prosecutor;
2. The criminal and civil investigation of those involved with any gain of function research that may have been responsible for the creation of SARs-COV2;
3. Investigations – criminal and civil – into the deceptive and misleading push for the gene therapy injections that have been falsely labeled as vaccines (only after the definition of “vaccine” was changed); a. This should include RICO and fraud claims (as is appropriate) involving the “Trusted News Initiative”, the drug companies, hospital systems, and some government actors;
4. Transparency legislation that gives the public immediate access to the raw data and submitted documents related to the shots and COVID “pandemic” – If there is nothing to hide, NO ONE should oppose transparency; a. This should be passed on the state level as well;
5. Liability for injury from vaccines under the same rules as any other product – if they are safe, there should be no opposition to liability to help those that have been injured;
6. Legislation that recognizes the absolute right to reject medical treatment or vaccination of any type for ANY reason;

7. NO funding for state/federal contracts with ANY organization that discriminates based on vaccination or health status;

8. Funding for the hundreds of thousands of individuals injured by job loss and "vaccine" injury;

9. NO on vaccination status tracking legislation; and

10. Our local law enforcement to uphold their oaths to uphold the Constitution and refuse to enforce unconstitutional mandates and rules.

Subject: mandate

External Email

I am emailing you in reference to the voting that is taking place today on the Covid 19 mandate for children to enter schools.

I strongly oppose this mandate. I will be home schooling if this takes place in our state- which will pull me away from my full-time Clinical Practice.

The risk for children is low for Covid-19 but the risk they are taking with the vaccination runs high (we now know there is a high risk of myocarditis).

If teachers feel unsafe they should mask and vaccinate.

Please consider all facts before voting today.

Thank you for your time.

If an entire nation is NOT going to isolate there + & - Covid-19 w other health issues in hospital!

Then why should there be forced quarantine and isolation camps ect. In our state of WA that is neighbors with Canada? Get rid of all WAC pertaining to forced quarantine and isolation.

Sincerely
Monica Campbell
Citizen and resident of WA state and USA

Subject: No on Covid Vaccine Mandates for Children

External Email

To warrant adding Covid Vaccines to the schedule of vaccinations for school enrollment one fundamental question must be asked and verified: Is there a risk of this disease causing death to the child? The CDC has answered this question in their own data - school-aged children have a 0% mortality rate to Covid. The data is clear and unquestionable - vote NO to adding Covid vaccines to the regular schedule.

FYI: VAERS Death Count 22,000+
Injuries 1M+

Subject: Attn: TAG K-12 Covid shot Mandate- Teachers Union prime driver of vaccine mandates

External Email

Dear TAG,

Did you know the Teachers Union donates millions of dollars to political campaigns and is a prime driver in the vaccine mandates for school aged children? Teachers Unions are not qualified to and should not be making this decision for our children.

According to the CDC children are at a statistically 0% risk of serious illness or death from Covid. The CDC also acknowledges, the vaccines do not prevent infection or transmission of the virus. Vaccine efficacy against Omicron is down to 27%, far below the 50% threshold required for FDA approval. Therefore, there is no need to vaccinate children against Covid.

On the other hand, there have been 41 reported deaths after COVID-19 vaccine among children aged 0 to 17. There have also been 602 reports of myocarditis and pericarditis and 51 reported cases of blood clotting disorders among children. It is evident that these vaccines carry serious risks for children.

Vaccine mandates override the right to provide informed consent for this medical intervention by not allowing patients or parents to make their own decisions. Considering the low Covid-related risks for healthy children, the risks associated with the vaccine, declining vaccine efficacy against new variants, the protection from any liability for vaccine manufacturers, it should absolutely be the right of every parent to decide whether to vaccinate their child.

Please do the right thing and let there be Choice with Covid vaccines.

Sincerely,

Theresa Lane

To Whom It May Concern:

We are very concerned about children having to be vaccinated. We adopted our son when he was 7 years old and knew nothing about his medical history. He seemed to be a fine healthy boy. When we got him he was all caught up with his vaccinations and didn't think much about it. Well, when he was 12 years old we had him take the flu vaccination and the Meningococcal and Td/Tdap booster. A few months later he got really sick from the flu. He had never been sick since we had him other than just sometimes a runny nose but never a temperature or throwing up or really sick. He was sick for 7-8 days and missed school for a week. He ended up having a temperature for 3 days and throwing up and just not feeling well for a while. After that about a month later, he slowly ended up with ticks and jerks and slowly got worse and worse. We were really concerned but didn't know what could be done about it. Fortunately, the ticks and jerks slowly went away but it took about 3 months for the symptoms to go away. We had no idea if this was going to be a permanent thing or not. I looked back in his records to see if anything like this had happened to him and found that he also ended up with ticks and jerks also the year he had 8 shots injected that year as well and this was a couple of years before we adopted him. Both times he ended up with the ticks/jerks, he had vaccinations.

Just recently a life insurance company also found out that there was an increase of deaths by 40% with people between 18-64 years old. Now, remember an insurance company does not want this to happen since they have to pay out and this was last year. There is such concern for the vaccinations that if you force parents for the kids to have them, you don't realize the medical issues or deaths and the heartache you are creating for the parents and especially for the children. If you truly care about the children, you will not force these vaccinations on the children to go to school.

If they had mandated these vaccines on our kids last year, I would have definitely pulled my child out of school and homeschooled him or sent him to a private school. Once you have a vaccine injury, you can't undo the damage and we all know Covid isn't killing kids like the media wants to portray it is. Please have some humanity and dignity for the people you say you care about. If you mandate the vaccines and give the parents no choice then the death and injuries are on you but if you give the parents the choice then that guilt is on the parents.

Thank you for taking the time to listen.

Subject: No to COVID Vaccine Mandates for Public Schools

External Email

To the Washington State Board of Health,
I am writing to you to ask that you do not make the COVID vaccine a mandate in order for children to attend public school and here is why:

- * The vaccine has only been approved for emergency use only at this point.
- * There are no long-term studies on the side effects of the vaccine and we don't know what kind of harm it could cause our children in the future.
- * We know that there is a risk for teens and young adults to get myocarditis and pericarditis from the vaccine.
- * Kids are not dying from COVID.
- * The vaccine does not stop the spread of COVID nor does it prevent someone from getting COVID.
- * This is not a vaccine like the Measles, Mumps, Polio, Chicken Pox and it shouldn't be required just like the flu shot is not required.
- * This should be a parent decision on whether or not a child should take have the vaccine.
- * There has already been about 40K children removed from public schools within the last year, if you make the vaccine a requirement you are going to see thousands more.

Thank you for taking the time to hear my concerns and the concerns of many other Washington parents.

Regards,
Katy Radelich

External Email

Dear BOH:

Please share with your TAG committee:

Response to # 5-6 on your criteria:

The sub set that has significant morbidity is 80+ year old people in nursing homes! All other age groups DO NOT have significant morbidity, especially school age children.

We could just as well extend your logic to protect the elderly by murdering all the children so there would be ZERO transmissions by children.

Again I ask, how much money is the health care industry receiving from the government to encourage you to sacrifice children for a EUA so-called vaccine with significant adverse reactions and NO ACCOUNTABILITY for vaccine makers, and NO TRANSPARENCY in their clinical trial data.

Stop this attempt to get children on a vaccine schedule that will insure no liability.

External Email

To whom it may concern,
I am reaching out to you today in regards to the consideration of covid vaccines for school children. I deeply understand the need for the safety of children and teachers however, this vaccine does not stop transmission or prevent sickness. I cannot understand and just cannot wrap my mind around why we would even consider this type of vaccine for our children without the true test of time. The damage that could be done is irreversible. Choosing to vaccinate your child based on your own families health and circumstances is one thing, considering it a vaccine (which it is NOT) needed for school is quite another. The risks deeply out weigh the benefit and it is my hope and prayer that you will NOT consider a covid vaccine for any school children. Thank you.

Subject: Concerns with parent/caregiver survey

External Email

Good morning!

This morning, someone shared the TAG survey to assess and evaluate the COVID-19 vaccine as a requirement for entry to schools and child care. I understand the survey closes today, and wanted to share two concerns.

First, many of us weren't aware that this survey existed. We would have been happy to support outreach in our own communities, which include parents, families, child care providers, community based organizations, school administrators, and other caregivers.

Second, it appears that the survey is only offered in English. The disparities in health and other outcomes as a result of the pandemic are extensive and well documented. Offering this survey only in English effectively means you will not hear the voices of families who aren't native English speakers – a significant and important portion of our communities.

I hope you'll consider re-issuing this survey, and working to ensure it is accessible and shared with a diverse range of families and caregivers. If you'd like to talk more, please let me know.

Best,

Jessica Tollenaar Cafferty

Re: February 10, 2022 agenda item - adding Covid 19 vaccinations to required list for students.

The prudent thing to do would be waiting to see study results regarding natural immunity and some longer term studies regarding vaccine adverse reactions. These are our children, tomorrows leaders. Let us safeguard them until we have more information. Does anyone know how many children were in the test group before the emergency use authorization was granted?

A Covid-19 vaccine mandate clearly does not pass the 9 criteria required when Reviewing Antigens for Potential Inclusion in WAC 246-105-030. I am not taking issue with the vaccine itself, and in fact continue to encourage vaccination in my community. My lack of support for a mandate stems from the following criteria not being met under sections II and III on the list of criteria:

II. Disease Burden Criteria

5. The vaccine containing this antigen prevents disease(s) that has significant morbidity and/or mortality in at least some sub-set of the population.

- The vaccine has been directly available to every vulnerable sub-set of the population for some time.

6. Vaccinating against this disease reduces the risk of person-to-person transmission, with transmission in a school or child care setting or activity being given the highest priority.

- It is widely proven that vaccinated individuals can and do continue to transmit the virus. We know this because this was the science used to justify mask mandates. Masks are mandated in schools already, regardless of vaccination status, to prevent the vaccinated from transmitting the virus.

III. Implementation of the Criteria

7. The vaccine containing this antigen is acceptable to the medical community and the public.

While the vaccine may be acceptable to the medical community (although we will note that even within the medical community, the vaccine adoption rate was not acceptable enough to preclude a forced mandate), we cannot gloss over the fact that public acceptance does not even represent a strong majority.

- Under 51% of Spokane County residents are vaccinated. (srdc.org
<<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fsrdc.org%2F&data=04%7C01%7C>
>)
- Less than 40% of kids 12-17 are vaccinated. (srdc.org
<<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fsrdc.org%2F&data=04%7C01%7C>
>)
- Only 36% of the entire black community in Spokane County is vaccinated, and it is reasonable to assume this number is far lower among ages 12-17. A vaccine mandate in schools would disproportionately affect students of color in our community. (srdc.org
<<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fsrdc.org%2F&data=04%7C01%7C>
>)

8. The administrative burdens of delivery and tracking of vaccine containing this antigen are reasonable.

- Our administrators and nurses have already given feedback that a vaccine mandate would create an unreasonable and insurmountable administrative burden involving tracking.

9. The burden of compliance for the vaccine containing this antigen is reasonable for the parent/caregiver.

- As stated in the above vaccination statistics, parents are choosing not to vaccinate their children. Forcing them to do so (as with other segments of our society who were coerced under the threat of losing their jobs and livelihoods) does not fall within a reasonable burden of compliance. It does not seem logical to vaccinate a group (ages 0-19) with such a low, even insignificant, rate of hospitalization or death, while claiming that will protect a more vulnerable group (ages 50-90) with a dramatically higher rate of vaccination (between 62%-82% based on age). Thusly, our state would propose forcing vaccination on those who do not need it, to protect those who already have it and/or could easily get it.

The vaccine is widely available to any age group now. Vaccination rates reflect individual health choices that must be protected. We have to acknowledge that individuals can make their own health decisions for themselves and their families. There simply is not a case to be made for forcing someone to get vaccinated to protect someone else who can easily get vaccinated themselves.

Hello,

As a parent I do not feel comfortable allowing my children to get an injection of a new vaccine or medication that has not had any long term studies done on it. The Covid vaccine has not been used long enough to properly know what if any long term side effects it may cause. I do not want to find out years from now that there are side effects that are serious and we shouldn't have given this to our children. It is just too new to know! We must not mandate this vaccine for children who have a much greater risk of death from suicide than Covid! Please do not let this vaccine become part of the required immunization schedule, it is just too new and frankly not necessary!

Sincerely,

Subject: mRNA Drugs

External Email

Good Day,

I trust you are all aware that a suit has been brought in the World Court against the primary promoters of these dangerous gene therapy drugs. The plaintiffs, promoters and participants in this suit are world class professionals with incomparable credentials. There is no fake news, misinformation or radicalism involved. The promotion and advancement of these drugs is shameful at any level. Fully mRNA "vaccinated" people contract, spread and die from the COVID virus. Our health system denies early treatment until a COVID patient can be given more dangerous, ineffective and expensive drugs just before they become a death statistic. This blind push for all to receive as many patented drugs as possible must stop. Health and healthy living does not and will not come from a needle. Can you for a moment please consider how a country, indeed world, can go all in on a drug with unknown efficacy and side effects and deny the use of known safe and effective drugs. mRNA drugged people are suffering horrible adverse reactions and the full extent of this carnage is not yet known. Post mRNA introduction all cause deaths are up dramatically. It truly is insanity. That anyone would even consider giving these drugs to children is criminal. A human under 70 years of age is far more likely to die from the drugs than the virus. Please stop the poisoning.

Subject: HB 1684 Fluoridation

attachments\E59884BAE715484F_HB 1684 Fluoridation 2 1 22 Osmunson (1).pdf

External Email

Dear Washington State Board of Health, Keith Grellener, Tom Pendergrass, Elisabeth Crawford, Temple Lentz, Vazaskia Crockerell, Fran Bessermin, Bob Lutz, and Umair Shah,

The Legislature has asked the Board of Health for advice on HB 1684 Fluoridation to be provided within 10 days. Ten days is not enough time for the smartest person in the world to carefully review all streams of evidence on all sides. Tradition supports fluoridation. Please consider science rather than endorsements.

The US Food and Drug Administration and the Washington State Board of Pharmacy, all Pharmacopeias and most developed countries have determined fluoride when marketed for ingestion with the intent to prevent dental caries is a legend (prescription) drug.

The research is clearly showing too many (70%) of children have dental fluorosis, a biomarker of excess fluoride exposure.

The research is clearly showing mothers on fluoridated water and infants ingesting fluoridated water used to make their formula result in developmental neurotoxicity (lower IQ). In the last 4 years, 22 human studies report lower IQ. Grandjean et al 2021 reported 5 IQ loss with mother's urinary fluoride concentration at 0.7 ppm. Urine fluoride concentration mirrors the fluoride concentration of water the mothers and infants are ingesting and a Benchmark Dose for only 1 IQ loss is 0.2 ppm.

HB 1684 is built on historic tradition without looking at the current science. Dental caries are not highly contagious or lethal like COVID and fluoride ingestion should not be mandated when so many are showing signs of excess fluoride. Makes no sense to give those with too much fluoride even more.

Fluoride is now considered as lethal to the developing brain as lead. Although HB 1684 does not mandate fluoridation, it pressures more water purveyors to fluoridate their water.

Proponents have never answered the most fundamental question of how the fluoride gets from the blood in the tooth to the surface of the tooth where caries start or have started. No known mechanism for fluoride transfer through the tooth is known. Researchers are now reporting swallowing fluoride has little chance of reducing dental caries. No metabolic function requires fluoride. Fluoride is not a nutrient.

Proponents rely on endorsements, tradition and one side of the science. Please review the attached for more evidence. The Board has a great deal of historical evidence from previous submissions.

Please advise the Legislature to not pass HB 1684 until a more thorough and careful review of the science can be achieved.

Sincerely,

Bill Osmunson DDS MPH

Comments Regarding HB 1684 and Water Fluoridation

Bill Osmunson DDS MPH
American Environmental Health Studies Project, Board Chair
billosmunson@gmail.com

HB 1684 is a public health danger and very expensive.

Comments are presented below in summary form, followed by a more detailed review of some serious errors with HB 1684. Finally, the need for notifications to water users regarding the potential for fluoride overexposure and risks is presented.

Summary: See also [Fifty](#) reasons HB 1684 will harm the public

The lack of individual freedom of choice, excess exposure, serious risks and lack of FDA approval make HB 1684 harmful to public health. Hundreds of published research studies reporting fluoride's danger have been published since the 2006 [NRC report](#) for the EPA on fluoride in water. The 12 members were unanimous the Maximum Contaminant Level Goal as set by the EPA is not protective.

Yes indeed, the EPA classifies fluoride as a **contaminant** and HB1684 pushes water purveyors to contaminate their water. The legislature should not promote the contamination of water. The risks raised in 2006 included risks to [teeth](#),¹ [musculoskeletal](#), [reproductive](#), [neurotoxic](#) and neurobehavioral, [endocrine](#), [GI](#), [renal](#), [hepatic](#), [immune](#), [genotoxicity](#), and [carcinogenicity](#). Those links are for about 10,000 published studies reporting harm from fluoride. Each one of those links provide ample evidence to stop fluoridation rather than further overdosing the public.

Of urgent concern is fluoride's effect on the developing brain. Below are listed 22 human studies published from 2017 through 2021. Fluoride is presumed to be a developmental neurotoxin, more toxic than lead, lowering IQ. Lower IQ is known to increase special education in schools and drop outs, increase incarceration rates, increase crime, increase divorce and increase job loss. HB 1684 increases human suffering and significant monetary costs to society.

Grandjean et al,² 2021 "[A Benchmark Dose Analysis for Maternal Pregnancy Urine-Fluoride and IQ in Children](#)" reporting 1 IQ loss at 0.2 mg/L mothers urine fluoride concentration must be carefully reviewed by the legislature and Washington Board and Department of Health. Note, urine fluoride and water fluoride concentrations are similar. At fluoridation concentrations of 0.7 ppm (same as mg/L), 5 IQ points are lost. The highly respected international authors have more than a thousand published studies, many in the area of toxins on the developing brain. Their expertise has been accepted by research publications, courts and universities.

¹ All 12 members of the NRC committee agreed the MCLG should prevent dental fluorosis. See page 23

² Phillippe Grandjean is Professor at the T.H Chan Harvard School of Public Health and University of Southern Denmark. Howard Hu and Morteza Bashash are at the Department of Preventive Medicine, Keck School of Medicine USC. Christine Till and Rivka Green and David Flora, Faculty of Health, York University, Martha Tellez-Rojo, Mexico, Peter Song Department of Biostatistics, School of Public Health, University of Michigan, Bruce Lanphear Faculty of Health Sciences, Simon Fraser University, British Columbia,, Esben Budtz-Jorgensen Department of Biostatistics, University of Copenhagen, Denmark.

A careful scientific review inclusive of all stakeholders (including vulnerable members of the public) rather than blind trust in historic flawed policies and laws, needs to be a top priority.

HB 1684 is NOT supported by a careful review of current science. Topical fluoride has benefit, swallowing does not. Studies supporting fluoridation are mostly historic and have serious flaws. Water fluoridation as promoted by HB 1684 will cause harm in many ways, which constitutes negligence³ on the part of those promoting this bill, advocating for it, and voting for it. Some harms are outlined below in the remainder of the summary, and are described in further detail with citations following the summary.

HB 1684 will most seriously harm the unborn, infants, and children, and fails to warn pregnant mothers and caregivers of known risks. Fluoridation has similar if not greater risk to the brain than lead.

HB 1684 is built on historical policies and assumptions, marketing and trust rather than current science. Many studies have been published and more than 50 streams of evidence must be considered which have significant impact on HB 1684. A careful review of the science takes a great deal of time.

HB 1684 will harm the developing brain and teeth and will increase the burden to schools, businesses, parents, and society while having no FDA approved health benefit.

HB 1684 fails to provide individual recommended fluoride dosages for benefits and risks. Although water systems regulate the concentration of fluoride in water, they do not regulate the amount of water each person drinks. Therefore, individual dosage is unregulated and of most concern to the unborn and infants.

HB 1684 fails to notify water purveyors that the Washington State Board of Pharmacy determined that the ingestion of fluoride with intent to prevent dental caries makes fluoride a **prescription drug**. The US Food and Drug Administration has determined that fluoride for ingestion is an **unapproved drug** and the evidence for its efficacy is incomplete. Pharmacopeias list fluoride as a drug. If not regulated as a drug, fluoride fits within the definition of poison per RCW 69.38.010 (i.e., a substance that, when introduced into the human body in quantities of sixty grains or less, causes violent sickness or death). Note: 60 grains is 3,888 mg, and fluoride can cause death at 5 mg/kg body weight, or around 250-500 mg for an adult, less for a child. Fluoride is a poison under this RCW definition, however, it is exempt from poison laws in Washington State when regulated as an approved legend drug or exempted by law.⁴ Fluoride is not FDA approved, has no approved label, and no NDA number.

The World Health Organization's Technical Report Series 846, *"Dental and Public Health administrators should be aware of the total fluoride exposure in the population before introducing any additional fluoride program for caries prevention."* Many in Washington State are ingesting too much fluoride even without fluoridated water.

WHO's 1992 recommendation, *"Estimation of the amount of fluoride ingested from all environmental and dietary sources is important so that rational and scientifically sound decisions can be made when guidelines for the use of fluorides are reviewed periodically and modified."*

³ Negligence is defined as the failure to use the degree of care appropriate to the circumstances, resulting in an unintended injury to another.

⁴ A legend drug is a drug approved by the U.S. Food and Drug Administration that can be dispensed to the public only with a prescription from a medical doctor or other licensed practitioner.

During public testimony 1/25/2021, the Local Government Committee chairman mentioned that the legislature has asked the DOH (I believe it should be WSBOH) to advise on the safety and efficacy of fluoridation within the next 10 days. With many serious streams of evidence needing to be considered, and Federal reviews of just one of those streams of evidence has taken decades, the WSBOH will not be able to provide a complete literature review and reasoned studied advice. A cut and paste of historical policy and unscientific marketing opinions is inadequate and will result in harm to the public. As stated earlier, an unscientific review would constitute willful negligence on the part of the legislators promoting this bill and those voting for it.

Fluoride's mechanism of action is topical, not via ingestion. Fluoride works by interacting topically after teeth erupt. The evidence for its effectiveness when applied to erupted teeth is well supported. Fluoride incorporation into developing teeth is very minor and does not contribute to caries prevention. Fluoride is not a nutrient nor essential for any bodily function. A very small amount of ingested fluoride makes its way to saliva to provide some topical fluoride after tooth eruption, but this amount is 50 to 100 fold less than what is obtained from fluoride that is present in food and beverages. Enamel and dentin demonstrate significant transport hindrance. The effective pore radii of the transport pathways in the enamel are approximately 0.7-0.9 nm.

Many are ingesting too much fluoride and are overexposed. The two charts below, [Neurath et al, \(2019\)](#) compare dental fluorosis rates as reported by the National Health and Nutrition Survey, in the 1999-2004 and 2011 to 2012 survey periods. Moderate and severe dental fluorosis has significantly increased in the roughly 10 years between these two surveys.

[Dong et al \(2021\)](#) looked at the NHANES 2015-2016 and reported 70% of children and adolescents in the survey have dental fluorosis. [\(NIDCR\) Oral Health in America](#) is a sobering admission Oral Health in the United States needs to improve but even more fluoride is not the answer.

HB 1684 puts more emphasis and money on a failed public health policy rather than taking a fresh look at alternatives to better address oral health. Using a toxic chemical, a legend drug with an uncontrolled dose, to try to prevent dental caries, not only fails because it can't prevent caries but the policy is flawed because the policy fails to help those children develop good oral health habits which prevent other diseases such as periodontal disease, oral cancer, and good overall health.

Studies typically cited to support water fluoridation are of low quality, need to be carefully evaluated and understood, and need to be considered with all of the more recent streams of evidence.

Studies concluding fluoridation is effective, have problems, which include but are not limited to: not one study corrects for unknown confounding factors which is most important, not one prospective randomized controlled trial (RCT),⁵ socioeconomic status usually not controlled, inadequate size, difficulty in diagnosing decay, delay in tooth eruption not controlled, diet (Vitamin D, calcium, strontium, sugar, fresh and frozen year round vegetables and fruit consumption) not controlled, total exposure of fluoride not determined, oral hygiene not determined, not evaluating life time benefit, estimating or assuming subject actually drinks the water, dental treatment expenses not considered, mother's fluoride exposure not measured, breast feeding and infant formula excluded, fraud, gross errors, and bias not corrected, and genetics not considered. The FDA is correct, the evidence for efficacy is incomplete.

Note the "Fluoride Rich Zone" figure to the right. When the tooth is sectioned like slices of bread and the fluoride concentration measured in each slice, the fluoride concentration in each slice is similar regardless of fluoride intake except on the outside layer from topical fluoride. Fluoride does not migrate through the tooth as we were taught in dental school.

No agency accepts jurisdiction for determine the safety, dosage, label and benefit of fluoridation. In a letter from the Washington State Department of Health (WSDH) I was informed the WSDH *"will rely on known national entities like the CDC and EPA to assess the science"* on fluoridation.

The Washington State Legislature relies on the WSDH who rely on agencies not responsible for determining the safety, efficacy, dosage and label of the fluoride drug. Neither the CDC nor the EPA⁶ are charged by Congress to regulate the addition of fluoride in water with the intent to prevent disease. The EPA is prohibited from adding anything to water for the treatment of humans, EPA treats water. EPA relies on the FDA. The FDA does not regulate public water systems. When the CDC warned care givers to avoid using fluoridated water to make infant formula, the WSDH disagreed and protected policy rather than infants.

Jurisdiction of fluoride is like a hot potato tossed to "someone else" and no one has jurisdiction. HB1684 should be amended to designate an agency(s) to have jurisdiction. Congress has charged the FDA with jurisdiction and the Washington legislature should do the same. Once fluoride is FDA approved, the dispensing of fluoride in water needs to have WSDH jurisdiction.

⁵ A prospective study is an epidemiologic study in which the groups of individuals (cohorts) are selected on the bases of factors that are to be examined for possible effects on some outcome. For example, the effect of exposure to a specific risk factor on the eventual development of a particular disease can be studied. The cohorts are then followed over a period of time to determine the incidence rates of the outcomes being studied as they relate to the original factors in question. Also called a cohort study. Examples include concurrent cohort studies and randomized controlled trials.

⁶ Safe Drinking Water Act Section 1412 (b)(II)

I. REVIEW of HB 1684 Flaws

Sec. 1 (1) claims fluoride is a proven mechanism for reducing health disparities affecting people of all stages of life.

Consistent and undisputed evidence demonstrates there are disparities in health and oral health. However, fluoridation has not and does not close those disparities (e.g., see [\(NIDCR\) Oral Health in America](#)). The science is robust, HB1684 will make disparities worse by causing harm to many.

A Cochrane analysis (2015) of fluoridation research lacked a single RCT, reported studies to be mostly historic, mostly of naturally occurring fluoride with high mineral content, before much toothpaste was used, no life-time benefit, no benefit for social disparities, but studies available did find relative benefit from tooth decay. We will show how those studies of benefit have serious flaws.

Studies reporting increases in dental caries in low socioeconomic cohorts are low quality with many flaws (see [Neurath et al \(2017\)](#))

Sec 1 (2) “The legislature further finds . . . fluoridated water promotes community oral health. . . ”

Fluoridation does not promote health or reduce disparities. The graph below is from data of the National Survey of Children’s Health, US HHS, 2005. Note the 50 states of the USA and reported “good to excellent teeth.” About 80% of the wealthy have good teeth and about 52% of the poor report “good to excellent teeth.” However, fluoridation has no common cause. Oral health and health equities would be better with fluoridation money spent on improving income and health education rather than imposing a highly toxic chemical with serious side effects.

Sec 1(3) “The legislature further finds . . . bridge social inequities” See comments on Sec. 1(1). No quality research demonstrates fluoridation bridges social inequities.

Sec 1(5) “The legislature further finds . . . fluoridation is cost-effective. . . ” The legislature relies on assumption of benefit and estimates the cost savings based on that flawed assumption.

[Ko \(2015\)](#) estimates a savings of “\$3 per person per year for best-case scenario, but this savings is eliminated by the estimated cost of treating dental fluorosis.”

[Maupome \(2007\)](#) compared cost of dental treatment for children in health maintenance organization (HMO) members in fluoridated Vancouver, WA ((\$186/year) with unfluoridated in Portland, OR (\$180/year) and found enough savings to pay for equipment repairs, but not for the costs of installing the equipment, introducing the chemicals, or the costs of treating dental fluorosis. About 2% difference is within the differences in diagnosis and treatment skills of the dentists.

Estimates usually do NOT include the cost of: 1) other chemicals added (e.g., pH balancing chemicals to reduce damage to water system infrastructure) because hydrofluorosilicic acid (HFSA) is used, 2) fluoride testing, 3) record keeping and reporting, 4) extra hazmat precautions and training, 5) fluoride equipment maintenance, upgrades & replacement, 6) fluoridation promotion such as HB 1684, 7) added liability insurance and legal fees, 8) holding fluoridation plebiscites, 9) HFSA spills and fluoridation overfeeds, 10) avoiding fluoride in families sensitive to fluoride, 11) treating objectionable fluorosis, or 12) treating other fluoride-related health problems.

Frequently proponents suggest they are only adjusting the natural fluoride concentration in the water. If the natural concentration of arsenic, lead, or other toxins were “adjusted” higher, we would also object. “Natural” fluoride is generally found in the form of calcium fluoride, a less toxic form of fluoride than the industrial waste product HFSA. In addition, the bioavailability of added fluoride chemicals like HFSA varies depending on the hardness of the receiving water. Washington State for the most part has relatively soft water, and thus the bioavailability and potential intake of fluoride into body tissues is greater than locations where the water is harder. Generic policies regarding target concentrations of fluoride fail to account for these types of important factors determining exposure.

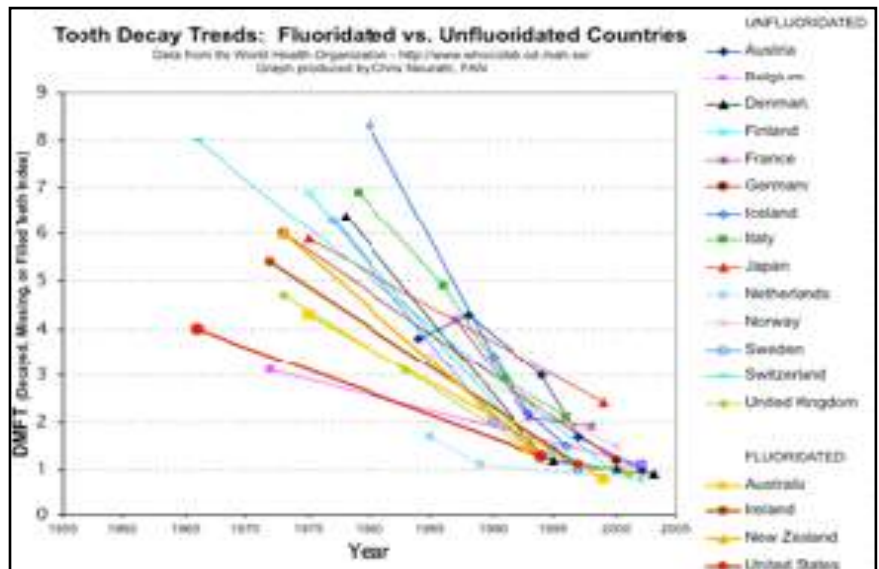

Sec 1 (6) “The legislature further finds. . . fluoridation. . . is essential”

Fluoride is not an essential nutrient. Dental caries are not due to inadequate fluoride ingestion. For example, scurvy is the result of inadequate vitamin C, dental caries are not the result of inadequate fluoride ingestion. British Columbia has lower dental caries rates without fluoridation than Washington State. Oregon with about 19% fluoridated has slightly lower caries than Washington with about 44% of the population fluoridated. Some areas of Europe have lower caries rates and no fluoridation. Fluoride is not an essential mineral for the body, it is a toxin.

Two studies published using WHO data graphically demonstrate dental caries decline regardless of fluoridation. Fluoridation is not essential for good oral health.

Chen et al, BMJ 5 October

Neurath: Fluoride Research 2006

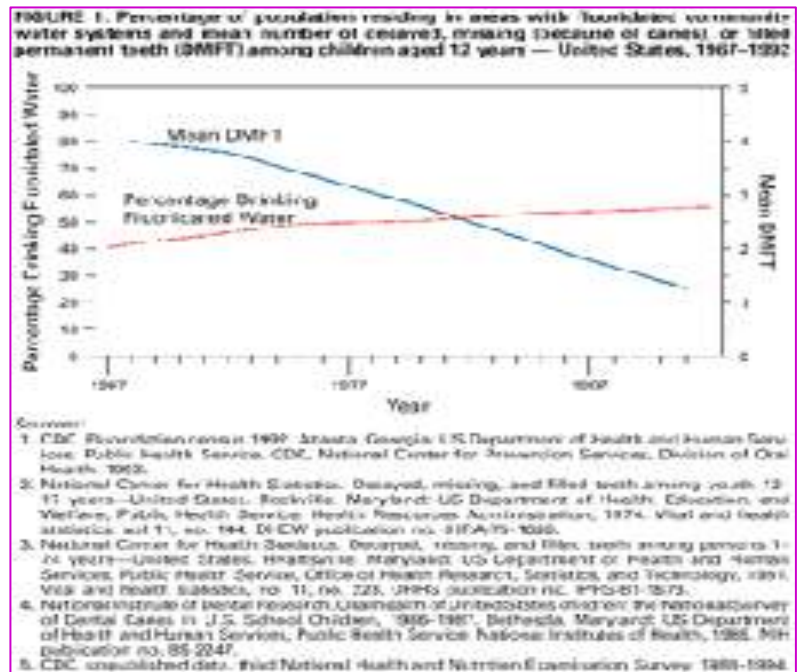

Colquhoun 1997 ISFR published the following graph illustrating the decline of dental caries prior to fluoridation. No studies on fluoridation address the factors causing a dramatic reduction in dental caries prior to fluoridation. As can be seen above, other countries continued the decline regardless of fluoridation status. The FDA is correct when finding the evidence for benefit from fluoride ingestion is incomplete.⁷ The recent PPTOX keynote speaker, former director of the US NTP and OHAT confirmed ingested fluoride would not reduce dental caries.⁸

⁷Published in Drug Digest 1975

⁸ Prenatal Programming Toxicity Conference, January 2022, Del Linda Birnbaum retired from National Toxicology Program and Office of Health Assessment and Translation 771717

In contrast, the CDC presents Figure 1 of support for fluoridation. At first glance it appears an increase in fluoridation reduces dental caries. However, the CDC cherry picked the years. Indeed, caries declined and percentage of the population fluoridated increased but the two events are unrelated. Caries rates were declining regardless of fluoridation. And consider perhaps more of the public were randomly fluoridated in cities and CDC would have us believe that resulted in an implausible 70% decline in dental caries. The fluoride was not targeted to high risk individuals.

The legislature has failed to provide current scientific support for the marketing claim that fluoridation is essential. Most dental caries decline took place prior to fluoridation. No one knows what factors were most significant in causing the decline, and no studies have corrected for those highly significant unknown factors.

Consider these countries response to fluoridation:

Austria	REJECTED: "toxic fluorides" NOT added
Belgium	REJECTED: encourages self-determination – those who want fluoride should get it themselves.
Finland	STOPPED: "...do not favor or recommend fluoridation of drinking water. There are better ways of providing the fluoride our teeth need." A recent study of Finnish data found "...no indication of an increasing trend ...of caries."
Germany	STOPPED: A recent study of German data found no evidence of an increasing trend of caries.
Denmark	REJECTED: "...toxic fluorides have never been added to the public water supplies in Denmark."
Norway	REJECTED: "...drinking water should not be fluoridated"
Sweden	BANNED: "not allowed". No safety data available!
Netherlands	REJECTED: "...at present the addition of chemicals to drinking water is prohibited by law in the Netherlands. This law came into effect because it was widely perceived that drinking water should not be used as a vehicle for pharmaceuticals. Furthermore, fluoridation of drinking water would conflict with the freedom to choose for natural drinking water. This principle of freedom of choice is considered as an important basic principle in the

Netherlands.” [SOURCE](#): 2007 – RIVM report 270091004/2007 for the Dutch Ministry of Health, Welfare and Sports.

Hungary STOPPED: for technical reasons in the '60s. However, despite technological advances, remains unfluoridated.

Japan REJECTED: "...may cause health problems...." The 0.8 -1.5 mg regulated level is for calcium-fluoride, not the hazardous waste by-product which is added with artificial fluoridation.

Israel SUSPENDED mandatory fluoridation until the issue is reexamined from all aspects.: June 21, 2006 “The labor, welfare and health Knesset committee”

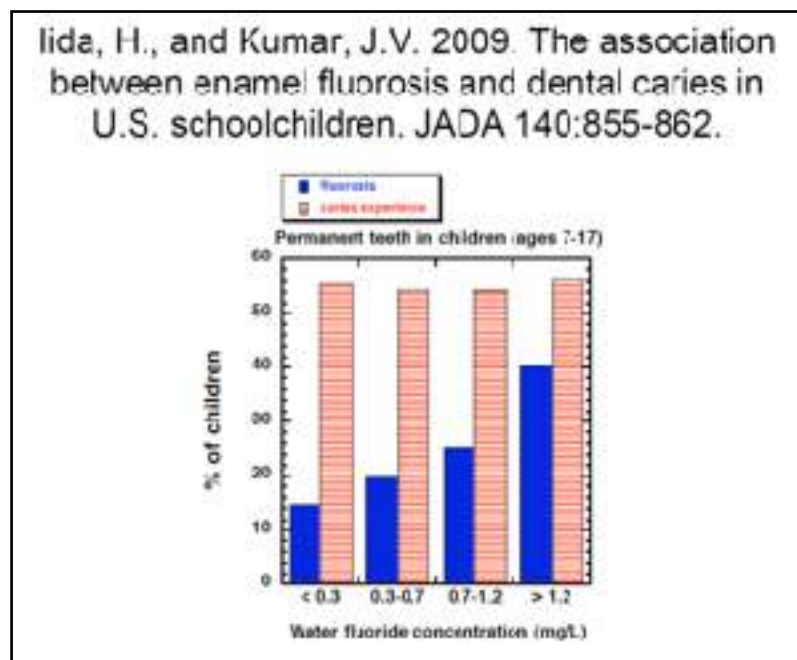

China BANNED: "not allowed“ China sells their fluoride toxic waste to the USA for us to drink in fluoridated water.

France REDUCED: Was 50% purchased fluoridated salt, decreasing to 30%.

US organizations opposed to fluoridation include the International Academy of Oral Medicine and Toxicology, International Academy of Biological Dentistry and Medicine, and the American Academy of Integrative Medicine.

Numerous USA organizations support fluoridation, but those are endorsements, not science, and those organizations do not accept jurisdiction or liability for fluoridation.

Some studies show increased dental caries with increased fluoride exposure. Note the graph below from Iida and Kumar (2009). With increased fluoride concentration, dental fluorosis increases and dental caries (red line) has very slight decrease between 0.3 and 1.2 mg/L and then caries increases with increased fluoride exposure at concentrations >1.2 mg/L.

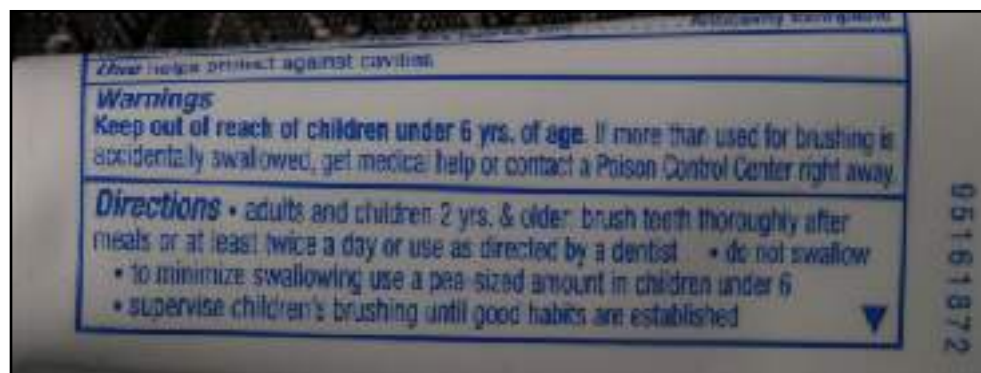

The American Dental Association provides this picture of Early Childhood Caries in its promotion of water fluoridation.

Fluoridation did not help that child. Are proponents of fluoridation suggesting that fluoridation only helps bottom teeth? No. This child has baby bottle caries, going to bed with a bottle of juice and sucking on it while sleeping. The tongue protected the bottom teeth to some extent but not the top. The damage is tragic, and health education would help, not fluoridation. Forcing water fluoridation of 100% of Washington State or the world will not help children like this, but health education can.

Fluoridated toothpaste is FDA approved. Note that the label states, "Drug Facts" because fluoride is a drug when marketed with the intent to prevent dental caries and is a drug because it is listed in the Pharmacopeias. The warnings on the label are especially intended to protect infants and children. The picture below shows a large pea size of toothpaste, which contains twice as much fluoride (about 0.5 mg) than the amount of fluoride recommended by the FDA in drinking water (about 0.25 mg per large glass of water). In other words, each large glass of fluoridated water contains about a quarter milligram of fluoride, which in the form of toothpaste, the FDA warns not to swallow.

FDA 1975 warned manufacturers of fluoridated supplements the evidence for efficacy was incomplete and maintains that position today.⁹ The FDA sent a warning to the company DS Waters of America that their fluoridated Nursery Water product is misbranded and illegal to be sold for children under the age of two. Fluoride ingestion has never gone through the FDA approval process, and fluoride is determined by both the FDA 21 USC 321 (g)(1)(B) and Washington State Board of Pharmacy to be a legend drug.

In 2013, Steve Neugeboren, Associate General Counsel of the EPA's Water Law Office [responded](#) to the question of who had jurisdiction over the fluoride added to water supplies as follows: *"The FDA, remains responsible for regulating the addition of drugs to the water supply for health care purposes."*

In 2001, the FDA testified fluoride is a drug. In 2012 FDA Donald Dobbs Consumer Safety Officer Division of Drug Information responded, *"... FDA has no authority to regulate fluoride compounds used to fluoridate public drinking water. . . is regulated by the US EPA"* SDWA.

EPA and FDA each assign jurisdiction for regulating chemicals used in water fluoridation to the other agency, and thus neither are taking responsibility for determining the safety and/or efficacy of the practice.

The EPA testified to Congress in 2001, "The EPA has no "empirical scientific data on the effects of fluosilicic acid or sodium silicofluoride on health and behavior."

The FDA warned manufacturers of fluoride supplements, *"...there is no substantial evidence of drug effectiveness as prescribed, recommended or suggested in its labeling. . . marketing is in violation of the new drug provisions of the Federal Food, Drug, and Cosmetic Act; they have, therefore, requested that marketing of these products be discontinued."* FDA Letter to 35 Companies (DRUG THERAPY 1975).

EPA scientists have expressed their concern through their union, *"In summary, **we hold that fluoridation is an unreasonable risk.** That is, the toxicity of fluoride is so great and the purported benefits associated with it are so small - if there are any at all – **that requiring every man, woman and child in America to ingest it borders on criminal behavior on the part of governments.**" Dr. J. William Hirzy, Senior Vice-President, Headquarters Union, US Environmental Protection Agency, March 26, 2001.*

Sec. 2 of HB 1684 attempts to pressure water purveyors to fluoridate their water and fails to explain the other sources of fluoride available to people, such as tea, toothpaste, and supplements. Giving people freedom of choice for treatment of a non-lethal and non-contagious disease (dental caries) is the ethical approach. Forced treatment without informed consent is not ethical.

The fluoride chemicals added to water are not pharmaceutical grade but have contaminants. Currently, a shortage of fluoride chemicals in the USA is forcing some suppliers to purchase fluoride from other countries (including China) and the contaminants in these sources are not monitored or known.

Sec. 4. HB 1684 appears to make discontinuing fluoridation difficult, in effect strong arming water systems with the assumption that the legislature knows best, and the assumption that fluoride ingestion has benefit

⁹ Drug Digest 1975

without risk. Science is dynamic and our understanding evolves. One size or dosage does not fit everyone. Variations in ages, genders, and the existence of other health problems make mass medication using an unapproved drug dangerous and illegal.

Sec. 5. HB 1684 calls for implementing assessments, but the assumption built into the bill is that fluoridation will reduce inequities. Connecticut, Detroit and Boston have fluoridated for over 60 years and report a crisis of dental caries. Kentucky (2003), fluoridated for 50 years, was awarded 100% fluoridated by the American Dental Association and yet ranked as the #1 highest state in number of edentulous residents (individuals without teeth). Fluoridation has not helped Kentucky. Giving a highly toxic substance to everyone without consent is not ethical or effective.

II. HB 1684 MUST INCLUDE A PROVISION FOR NOTIFICATION OF WATER USERS REGARDING THE RISKS AND POTENTIAL FOR OVEREXPOSURE TO FLUORIDE.

1. **Dental fluorosis** is an undisputed and known risk of fluoridation and brushed off by some as only cosmetic. Cosmetic harm is harm for some people. Damage to a person's face resulting in a scar is both harm and cosmetic. Dental fluorosis is a biomarker of excess fluoride exposure, and thus an indicator of potential harm to other tissues in the body. Fluoride promoters' assumption that the only risk of fluoride is to teeth, and the presumption that it is safe for all the other cells and functions of the body is seriously flawed. I sometimes treat dental fluorosis. Lifetime treatment for teeth damaged by fluorosis can cost over \$100,000 per person.

Below is an electron microscope look at dental fluorosis.

Below is an example of a “Fluoride Bomb.” Fluoride makes the tooth harder and more difficult to diagnose the caries, resulting in a bombed-out tooth when the caries are finally diagnosed.

Below are photographs taken before and after treatment of dental fluorosis, at a cost about \$1,000 per tooth, with an average treatment lifespan of 15 years (i.e., requiring future re-treatment). (Photo Courtesy of Dr. Markus)

Caregivers should be notified and clearly instructed not to give fluoridated water or fluoride supplements to their children, and to teach their children to spit out toothpaste before swallowing.

A 2009 review paper covering 17 studies found that *“Infant formula consumption was associated with a higher prevalence of enamel fluorosis in the permanent dentition”* Hujoel et al, JADA:2009,140:849.

The [CDC](#) states that *“Dental fluorosis only occurs when younger children consume too much fluoride, . . . when teeth are developing under the gums.”* And this is the same time during which fluoride is the most dangerous to the developing brain.

2. Development neurotoxicity from fluoride is a serious risk.

At a minimum, HB 1684 needs to require that water purveyors providing warnings regarding the adverse effects of excess fluoride exposure and the risks to vulnerable subpopulations.

For over four years the National Toxicology Program has been reviewing fluoride’s effect on the developing brain, developmental neurotoxicity. A [draft review](#) is available and is reported to be finalized later this Spring. However, the draft report does not include the most recent studies. In just a few months, the research has become more exact and specific reporting harm with ever lower fluoride concentrations.

Here are links to:

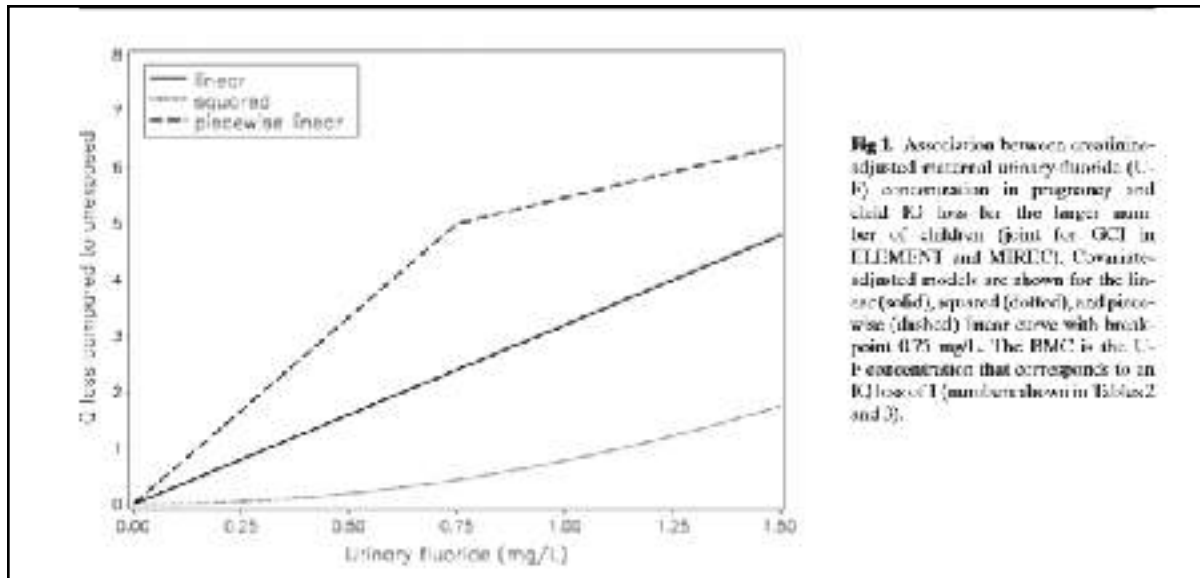

[23 human studies](#) published since 2017 on the association of fluoride exposure and reduced IQ.

[125 human studies](#) published on cognitive function and IQ score.

In 2021, Grandjean et al published [“A Benchmark Dose Analysis for Maternal Pregnancy Urine-Fluoride and IQ in Children”](#). This is the second fluoride benchmark study published that finds fluoride causing lower IQ and using measured data of urine-fluoride concentrations. The authors conclude, *“Thus, the joint data show a BMCL in terms of the adjusted U-F concentrations in the pregnant women of approximately 0.2 mg/L. These results can be used to guide decisions on preventing excess fluoride exposure in pregnant women.”*

Note that urine fluoride concentrations are similar to water fluoride concentrations, which make the measures used in these modern studies particularly valuable. Based on this study and others, water fluoridation at 0.2 ppm (mg/L) would cause loss of 1 IQ point. Fluoridation target concentration is at 0.7 ppm, and is reported to cause a loss of 5 IQ points. See Fig 1 below from Grandjean et al (2021).

Note Fig 1 below from Grandjean shows about a 5 IQ point loss with urinary (and water) fluoride concentration of 0.7 ppm.

Mothers consuming fluoridated water are lowering their child's IQ. Scientists are starting to evaluate the effect of toxins on sperm development, where it appears that fluoride may lower sperm count, and the effects may be carried on for 2 to 4 generations. ([2022 PPTOX Conference](#)).

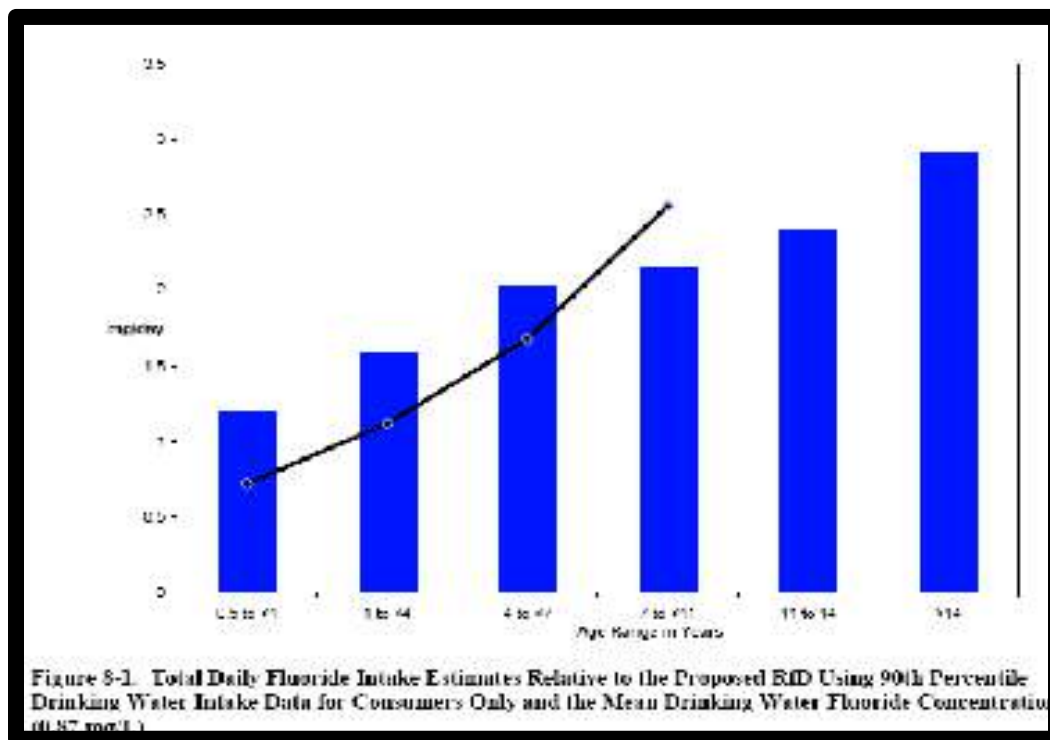

HB 1684 must require water purveyors that fluoridate to warn mothers to not drink fluoridated water and caregivers to not use fluoridated water for making infant formula.

The significance of 5 IQ point loss is illustrated in the two bell curves below. The low IQ have a disproportionate harmful effect. Our special education classes have a 57% increase. The number of gifted have a 60% reduction. How can we tell if an average child should have been gifted. "Frying" our children's brains has a serious impact on all of us.

In 2006, the EPA was advised by the National Research Council to do a Dose Response Analysis and Relative Source Contribution Analysis. Their report was published in 2010, and it showed that at least a third of children under seven years of age would exceed what was then considered as a safe dose of fluoride.

EPA's Figure 8-1 (reproduced below) graphically illustrates those most at risk. Note that infants are not included, even though these are an even greater at risk population. The percentage above the black line are ingesting above "safe" dosage levels. The black line is demonstrating redefining the "safe" daily dosage up by 33%, but even with that change, children will still not be protected. In addition, this figure only addresses water intake for 90% of the public, and does not address the 10% drinking the most water and infants are ignored.

The graph below ranks the 50 USA states and the reported “mental retardation” in 6 to 17 year olds per 10,000 population of their state. Although there are many factors affecting what is reported as “mental retardation,” fluoride does appear to have a common cause.

In 2016, the EPA was taken to court to defend a claim that their Maximum Contaminant Level for fluoride is not safe and allows for lowering of IQ to occur. The case is under the Toxic Substances Control Act in the Federal Court in San Francisco (Case Number: Civ. No. 17-CV-02162-EMC). EPA hired experts because the EPA claimed they don't have anyone capable of determining the toxicity of fluoride. The EPA is not capable of protecting the public from the risks of fluoride. The judge has scheduled the next hearing in the case for June 7, 2022.

Although the focus of fluoride researchers in the last few years has been on developmental neurotoxicity, other health risks from excess fluoride exposure to teeth, musculoskeletal, reproductive, neurotoxic and neurobehavioral, endocrine, GI, renal, hepatic, immune, genotoxic, and carcinogenicity must

also be reviewed. Consider a search on www.pubmed.gov for terms such as “fluoride cancer” “fluoride thyroid” and “fluoride _____” filling in the blank with each of the risks as listed by the NRC 2006 review of fluoridation for the EPA.

Thank you for your careful consideration of HB 1684’s serious flaws and vote NO.

Subject: Local control to lift mask mandates

External Email

Dear Ms. Donahoe,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

When is the next tag meeting ? Consideration of requirement for the Covid vaccine for kids have you guys talked to doctors about the side effects of the vaccine on kids and the long lasting effects it could have on their heart? Also has the board talked to doctors about immunity with kids and the kids that have already had Covid and kids that cannot receive the vaccine ? Has the board also taken into consideration that phase 3 testing of the childhood Covid vaccine testing will not be completed until May 20 26 I believe a lot of parents are reluctant to give the vaccine to their children for that exact reason .

Hello,

The due date of the "Caregivers & Parents Survey: COVID-19 Vaccine as a School Requirement" survey was broadcasted as February 2, 2022. I filled it out by got the following message when I tried to submit it:

This leads me to believe that the its validity is being tempered with. Please exercise caution making any recommendations on the basis of the survey. This experience is also shared with many others who took it to the social media.

Best regards,

Val Dimitrov

To the BOH:

I strongly oppose the inclusion of the potentially gene-altering Covid shots , commonly referred to as vaccines , as part of the requirement for school enrollment.

The COVID-19 experimental biological products are touted as safe and effective, yet the FDA and Pfizer are currently fighting in court (again) to delay releasing the safety data. What is there to hide? Where is the transparency? Why can't independent scientists review the safety data?

Reproductive toxicity has not been properly evaluated. There have been NO studies for genotoxicity and NO studies for carcinogenicity. Animal studies are incomplete and inadequate.

Once these shots are included as a part of the required vaccines for entering school the drug manufacturers & government cannot be held liable for any adverse reactions , either acute or chronic . So why the rush to vaccinate considering these shots have not gone through adequate testing and for which the safety data has not yet been released ?!

Children who become infected with SARS co-v2 typically experience mild cold or flu-like symptoms. Such a presentation of mild symptoms hardly warrants the forcing of an experimental vaccination ! And children have not been proven to be super spreaders of Covid.

And since the vaccines were designed for the original strain of this virus ; and since the virus keeps mutating as we've witnessed with this newest variant - Omicron ; and since these old vaccines have not proven very efficacious against the Omicron ,as we've seen in the large numbers of fully vaccinated people contracting Omicron, it seems like a waste of time , effort ,and potentially a risk , as the shots could do damage to the current good health status of each child, in an to attempt to vaccinate against today's or tomorrow's variant using an obsolete vaccine that was designed for yesterday's strain.

Thank you ,
Brenda L Oster , active-retired RN

Hello,

I am strongly opposed to mandating the Covid vaccine for children in order to attend school. This vaccine is unnecessary in children unless they are at high risk with immune compromising issues. The science has shown all along that children are not dying of Covid and IF they get it, symptoms are much like the flu.

We need to stop this overreach and leave it up to the parents to decide.

NO VACCINE MANDATE FOR KIDS!!!!

Regarding your Criteria #5:

The mRNA vaccines available currently do not work. You can see that in countries where the vaccination rate is the highest, such as in Australia, the rate of infection is way up, as well as deaths. <https://graphics.reuters.com/world-coronavirus-tracker-and-maps/countries-and-territories/australia/>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgraphics.reuters.com%2Fworld-coronavirus-tracker-and-maps%2Fcountries-and-territories%2Faustralia%2F&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C9d87bfd9f90b4aa7419708d9e>>

Israel is giving up, realizing that the vaccines do not work, placed an order for a vaccine called Novavax which is using old-fashioned protein technology.

Also, mRNA vaccines do nothing at all to stop spread of the virus, therefore it is completely pointless to vaccinate children, since the risk of adverse effects outweighs the danger of covid.

You could revisit this issue once the Novavax is approved in the US.

COVID testing company faked test results, lied to patients, WA lawsuit says

Jan. 31, 2022 at 3:55 pm Updated Feb. 1, 2022 at 7:18 am

https://www.seattletimes.com/seattle-news/health/covid-testing-company-faked-test-results-lied-to-patients-wa-ag-lawsuit-says/?utm_source=twitter&utm_medium=social&utm_campaign=article_inset_1.1

An Illinois-based coronavirus testing company with at least 13 sites in Washington, faked or delayed test results (or provided none at all), lied to patients and failed to properly store test samples, according to a lawsuit filed Monday by Washington state Attorney General Bob Ferguson.

The lawsuit, filed in King County Superior Court, describes how the company, Center for COVID Control, expanded to about 300 U.S. locations and allegedly took advantage of residents at a time when frequent testing was in high demand as a "critical tool in the fight against COVID-19."

"Center for COVID Control contributed to the spread of COVID-19 when it provided false negative results," Ferguson said in a statement. "These sham testing centers threatened the health and safety of our communities. They must be held accountable."

The suit also alleges the Center for COVID Control stored tests in garbage bags for more than a week, rather than properly refrigerating them; backdated sample-collection dates so stale samples would still be processed; and instructed its employees to "lie to patients on a daily basis" when Washingtonians asked about delayed results.

Ferguson also named Akbar Syed, Aleya Siyaj and Doctors Clinical Laboratory in the lawsuit.

Hello,

I am writing to comment on the recommendation of the Covid vaccine for attending public school in Washington. In the current situation, there is not enough data to support this vaccine being beneficial to kids staying in school. Unless we tested the entire population randomly, we would have no idea what the infection rates of Covid actually are. All of the data in King County is gathered through people actually driving to testing sites or choosing to report a rapid test, hardly a good measure of how many cases are in the community. Even my high schoolers know this, due to their excellent education.

Please don't tell us that there will be exemptions, without explaining what rules will apply to students with exemptions. This issue should be addressed now and not later.

By the time fall rolls around, this vaccine will be almost 2 years old and probably even less effective at stopping Covid than it is now.

I don't want to move my students out of our public schools here, but I will do so. They are excellent students and I will not have them missing school unless they are actually sick.

Thank you.

I am emailing you in reference to the voting that is taking place today on the Covid 19 mandate for children to enter schools.

I strongly oppose this mandate. I will be home schooling if this takes place in our state- which will pull me away from my full-time Clinical Practice.

The risk for children is low for Covid-19 but the risk they are taking with the vaccination runs high (we now know there is a high risk of myocarditis).

If teachers feel unsafe they should mask and vaccinate.

Please consider all facts before voting today.

Thank you for your time.

Hello Board Members,

I understand that you will be reviewing updates to the vaccination schedule and making a determination of the FDA emergency authorization Covid-19 shoots should be added per criteria 5 & 6. Based on my understanding of these two criteria, even if any of the shoots had been approved they still do not meet the requirements as follows:

- * Prevents disease: The CDC, FDA and WHO have all acknowledged that the Covid-19 shoots do not prevent the obtaining or spreading of the disease. It is only reducing symptoms and shortening the duration of the effects of the disease.
- * Disease morbidity and mortality: The CDC, FDA and WHO has all acknowledged that the morbidity and mortality rate from Covid-19 of school aged children without comorbidities is significantly low and is comparable to regular seasonal colds and flues.
- * Person-to-person transmission: Again, the CDC, FDA, & WHO have acknowledged that the Covid-19 shoot does not prevent this and that as the disease continues to mutate that the shoots are becoming even less effective at doing what little it did before.

At this time I hope you understand after reviewing all available information that is out there that adding the Covid-19 shoot to the list of required vaccinations is not justifiable at this time since it does not meet the criteria for 5 & 6, but also does not meet legal requirements and challenges that would arise if approved by the board. I request that adding the Covid-19 shoot to the list of required vaccinations is tabled, by voting no for its acceptance, until it meets the criteria for 5 & 6 and has been approved by FDA for use for all school aged children.

Thank you for your consideration of the above comments and your time for reading this and your service on the board.

Dear sir, we received an email from our school on February 1 regarding the survey for Covid vaccination if it were made a requirement for school entry . Apparently it closed the very next day on February 2(it may have reopened but the date of actual closure is unclear. As of today it is all closed Feb 6). Was it the state who gave us such a little timeframe to respond to the survey or was the school delayed in getting the survey to us? I'm wondering who I should contact regarding this. Thank you

Dear Ms. Lang,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

Subject: Washington Board of Health School Survey on Covid Requirement

External Email

To whom it may concern:

I wanted to respond to the Washington State Board Health Survey but it seems it is no longer available. This is a shame that you did not make clear the deadline or that you are preventing the community from voicing their opinions.

Requiring the covid vaccine for my children would be a burden on us financially. It would require my husband to take time off work or the funds for us to hire a babysitter and the cost of gas (which is increasing) so that we could transport our children to an additional appointment. It would also be a burden/traumatization for our children who don't like getting shots and who would then need three (two for the vaccine and a booster every six months).

Another concern we have about requiring this vaccine is the infringement on parental rights. I believe every parent should have the right to decide on medical treatment for their children. This vaccine has neither proven to be effective in stopping children from catching the virus or spreading it; that is very disappointing results. In addition there have been known adverse side effects in the test studies and it seems to be unethical to require such a vaccine.

Finally, requiring the vaccine would infringe on the right to education, without any real benefits (i.e. since the vaccine doesn't stop the spread or from catching it). How can you ethically bar children from attending school because they haven't received an ineffective vaccine? I am opposed to forcing an ineffective and potentially harmful vaccine at the expense of my children's education.

Sincerely,
Maria Plumb

I am writing because there is no proof that the vaccine is safe for children. In fact, there is proof that children who have been given the vaccine have died and have suffered from myocarditis and other heart inflammation issues. There is no published safety data for adults, never mind children. Personally, I took the vaccine and still got Covid, as did some of my friends. I have friends who were never vaccinated and never got Covid. Covid does not affect children severely, unless they have certain comorbidities. Why should we risk injecting our children with a vaccine that is approved for Emergency Use Only. This vaccine is not licensed for any human! We don't know how this will affect our children 20 years from now.

...to the list of required vaccines for students to attend school is a mistake.

1. There is no evidence of vaccine efficacy. The shots don't stop or slow the spread of infection and do not prevent infection.
2. The pharmaceutical companies do not have any liability for vaccine injuries and the vaccines have not been properly vetted.
3. There is no evidence supporting that benefits of the shots outweigh the risks of the shots.
4. Children do not appear to suffer major health problems as a result of getting or having had Covid.
5. This is a gross example of a government overreach. The people will not have it. Democrats and republicans are uniting on a new common ground: FREEDOM. There will be serious repercussions for the state as a whole....

Subject: Health survey for requiring COVID vaccine for students

External Email

Hello, I just found out about the Health survey for requiring COVID vaccine for students in the State of Washington

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fsboh.wa.gov%2FNews%2FArticles%2FSurveys-Now-Available-Parents-and-Caregivers-Provide-Feedback-to-the-TAG-Responses-Accepted-Until-Wed-Feb-2&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Cfb3c155901f145bc5c1508d9e6b9bb79%7C11d0e21726>>
and when I went to click on the links, it showed they were already closed.

It unfortunate there was such a low amount of responses that could be recorded and how little it was publicized to ensure it reached all parents. The schools send out vaccine clinic emails once a week but couldn't send one email asking for parents feedback for this forced mandate on a broad scale.

I strongly reject the idea of a vaccine mandate for school age children in the state of Washington. I live Bothell and my 7 year old attends the North Shore School District. With weekly testing the North Shore District has not had any major outbreaks. With weekly testing and proper remote school technology options in place, there is no need to risk kids life from having irreparable side effects.

I have been suffering from an adverse Pfizer vaccine reaction that has completely impacted my quality of life. I had no prior medical issues and now have daily neurological symptoms for which I am seeing 5 different doctors from neurologists, to immunologists, to holistic specialists for detox and 6 months later, I still have no relief after spending tens of thousands of dollars. I have reported it to VAERS, CDC and Pfizer and no one cares to help those injured from the vaccine.

I am not alone, there have been over 1MM adverse reactions reported to VAERS in the US alone. So many other countries are doing away with mandates and many colleges in the US have done so already.

If you enforce this mandate, you will thousands of parents pull the kids out from public schools which will greatly reduce you funding.

Please take this into have a proper survey via a proper survey tool to capture proper

feedback.

Thank you for your consideration.

Jennifer Lazo

To whom this concerns,

We have seen the enemy and it is the corrupted, bribed, coerced and complicit federal, state and city governments who have deliberately engaged in this planned-demic to create the greatest crime against humanity to date. You have destroyed our economy, social structure, abused our children who are essentially immune from this 99.9% survival rate flu. And then assaulting the population with a toxic life threatening inoculation which has permanently injured millions and outright killed hundreds of thousands, far exceeding any legitimate deaths from this flu, which has been gone for over a year now. The medical and scientific fraud is staggering, the cognizant dissonance and malice of Inslee's office and his very questionable relationship with the genocidal maniac and international despot Bill Gates is inexcusable. All the while using a fraudulent testing procedure(97% false positive and which tap water gives a positive result) to further cripple the population is beyond reprehensible. Any further ridiculous and draconian behavior from this body will not be tolerated. This fascist agenda Inslee is engaged in is an act of terrorism and treason and along with all your names , address and email, his information and crimes will be handed over to the Nuremberg court currently in session. I pray you do the right thing and rescind any further crimes against the people by supporting this fraud but i know you, like the despotic school board, are bribed and incentivized with billions of our tax dollars by this illegit Biden admin to assault the people and our children. You will be held responsible for your complicity and your complacency. Like DC, MSM, CDC, AMA, WHO, NHS, etc., this governing body has become the enemy thru your treasonous crimes against our republic and our constitution. There has never been a pandemic, no excess death and which effected less than one half of one percent of the population and for this you threaten concentration camps and police intrusion into our homes and businesses. Have you no morality or conscience?

This adventure has pointed out the incompetence and fraud which is the medical industry and how our despotic politician's prey on the people. Those who have awakened will never sleep again. I, for one, will never comply with this criminal enterprise, or my children and grand children. We have seen the enemy.

Sincerely,

Stephen Joseph Strickland

Pfizer's own trial data, are starting to be released in response to a Freedom of Information Act (FOIA) request to the FDA. Cumulatively, between Dec. 1, 2020, and Feb. 28, 2021 — a period of just 2.5 months — Pfizer received 42,086 injury reports, including 1,223 fatalities.

Why are life insurance companies reporting deaths are up 40% in 18-64 year olds? These are not COVID deaths.

These vaccines are not safe and nobody has any business telling a parent they have to vaccinate their children to be able to attend WA State schools.

Subject: WA DOH issues and failure of vaccines to prevent transmission

External Email

To whom this may concern,

My name is Dr. Clifford Knopik.

I am writing pertaining to the consideration of COVID-19 vaccines being required for school age children in order to attend school.

I am opposed to this because after spending a year and a half submitting public records requests to the WA Department of Health and analyzing the data returned I have found the following:

1) The WA DOH has made serious data collection issues that have corrupted their entire data set. This has resulted in the inability to have any reliable, accurate data to base public policy on.

2) The data that counties are gathering are now showing most cases and deaths are in the vaccinated population. For example, in King County, as of 2/2/22 61% of all cases are fully vaccinated people and 52% of all deaths are fully vaccinated people.

The vaccines do not stop the spread of COVID-19 and do not adequately protect people from COVID-19. The state's COVID-19 data is a shambles and inadequate to create public policy from. There is no other authoritative data for COVID-19 in Washington State.

The Washington State Board of Health should not require broken vaccines to be mandated and they should not base decisions on faulty COVID data. This would be irresponsible to do towards children.

I would love to meet with the board to walk through a presentation of my findings of the data issues I have uncovered and talk about the implications.

Respectfully,

Dr. Clifford Knopik

Dr. Clifford Knopik has a Doctorate in Computer Science from Colorado Technical University. He also has a Masters in Information Systems from Penn State, a Masters in Homeland Security from Penn State, a Masters in Information Assurance from Dakota State University, a Bachelors in Social Studies from Washington State University, an Associate in Emergency Management from Clackamas Community College, and an Associate in Computer Programming from Pierce College. He was honored to serve for five years in the Washington State Guard where he received emergency management training through FEMA and the Washington Emergency Management Department.

Subject: School survey about vaccinating children from COVID-19

External Email

To whom it may concern,

I received a survey link from our local elementary school (Greywolf Elementary) to take a survey about whether or not children should be vaccinated against COVID, but the link did not work for me so I figured I would just send an email.

My wife and I believe vaccination against COVID 19 should be up to the parents, not the state, not the schools. We will not vaccinate our children from COVID at this point for 2 reasons. The risk of COVID to children is incredibly small. And, being vaccinated does not prevent the spread of COVID, so vaccinating our children isn't going to go very far to protect the risk population. Even if there weren't the possibility of side effects, why give our children a shot that provides little to no benefit.

If our Public schools mandate that our children get the COVID vaccine our plan is to remove our children from the public school system. We have been looking at private distance learning schools, and local home school groups just in case this happens. We hope that the state and schools do not take this course of action because our children are thriving with their current teacher and love spending time with all the other kids in their class. It would make life more complicated for us, and tighten up our budget as well, but not enough to force us into following a policy we believe is wrong for our children.

Thank you for giving parents the chance to voice their opinions. I hope this helps.

In regards to requiring Covid-19 shots for public school. If this goes through my four children will not set foot in a public school again. As of this year I pulled my two school aged children out, as the Covid-19 restrictions in our public schools are not science-based and have turned our schools into environments that are not beneficial to my children. I had hoped that once the masks were dropped I could send my children back, but if a Covid-19 shot becomes a requirement I will be homeschooling indefinitely.

As you all are aware there is no current published literature on pediatric Covid-19 vaccine effectiveness in a K-12 setting. I would also remind you that children are not at any significant risk of serious injury or death from Covid-19, however they have been to the shots. That is an unnecessary risk I refuse to take. To date my household has had both Delta and Omicron variants, both times my kids barely got sniffles, with Delta they all had zero symptoms (ages 2 months to 14 years old at the time). While studies show Covid-19 is not something we have to worry about with our kids, anxiety, depression, and suicide have become something families have to worry about due to all of the Covid-19 restrictions that are not science based and utterly ridiculous. As a concerned parent with school aged children I am appalled at the lack of common sense and denial of science in lieu of politics and it is gross. Let parents decide whether their children get the shots or not, as that is a decision that should be up for the parents as we are supposed to be a free nation or is that not a thing anymore?

External Email

Hello, I had a question about the data shared during the VAC meeting on 1/13/2022.

In the data that showed COVID-19 hospitalizations at the beginning of the meeting, is this:

a) looking at people who have COVID and are in the hospital? OR

b) looking at people who are hospitalized BECAUSE of COVID?

I greatly appreciate this clarification.

Thank you,

Shawna Hill

Subject: Public Comment - NO Mandates for Kids

External Email

This comment is in regards to your upcoming vote forcing vaccines into our children.

You must NOT vote to force anything into our children's bodies. That is the sole responsibility of the parent. This notion that you know better than parents is despicable and should be criminal.

These vaccines do NOTHING to stop the transmission of the virus and certainly do not prevent contracting the virus. There is absolutely no point to this policy and even less point to pumping these kids full of a vaccine that doesn't work.

Lastly these presentations are full of cherry-picked statistics and percentages. This is clearly a concerted effort to ram this policy through against the will of the people.

Counting cases is pointless as stated by countless experts in the scientific community. It is a metric that should never have been used for a baseline.

Lastly, why are you advancing this ridiculous policy when other states with far worse metrics are rolling them back? Why do hate our kids so?

I implore you. You must vote no.

Subject: Attn: TAG on Covid shots for K-12 - Covid shots suppress Innate Immunity

External Email

Hello TAG,

In your process of making the decision to possibly mandate Covid shots for K-12 I would expect you are doing a deep dive into the Safety of the Covid shots. Thank you for taking the time to read this email.

It is odd that Safety is something that is not brought up in the BOH and TAG meetings I have watched. Nothing negative is ever said about the Covid shot, which is extremely concerning.

The only concerns TAG had in their first meeting was about the inconvenience to parents/caregivers to get children to a shot and how the schools and childcares would keep track of who has been vaccinated.

The only thing I have heard from BOH is that Covid shots are safe and effective and that everyone 5 and up should get the shots. How can any medicine be safe and effective for ALL?

To help with your research, which you are doing on behalf of all Washingtonians and their Children, I am providing you with a research paper by Dr. Stephanie Seneff that explains how Covid shots suppress innate immunity, see link.

<https://www.authorea.com/users/455597/articles/552937-innate-immune-suppression-by-sars-cov-2-mrna-vaccinations-the-role-of-g-quadruplexes-exosomes-and-micrnas>

Here are some key points :

* In a non-peer-reviewed research paper
<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.authorea.com%2Fusers%2F455597/articles%2F552937-innate-immune-suppression-by-sars-cov-2-mrna-vaccinations-the-role-of-g-quadruplexes-exosomes-and-micrnas&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C43b1f08b03054797e30e08d9e22ec3e9%7C11c>>

innate-immune-suppression-by-sars-cov-2-mrna-vaccinations-the-role-of-g-
quadruplexes-exosomes-and-
micrornas&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C43b1f08b03054797e30e08d9e22ec3e9%7C11c
last week, Stephanie Seneff, Ph.D., describes a mechanism of the COVID shots that
results in the suppression of your innate immune system. It does this by inhibiting the
type-1 interferon pathway.

* The COVID

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fchildrenshealthdefense.org%2Fde>
jab can cause neurons in your brain to produce toxic spike protein, or take up circulating
spike protein, and the neurons try to eliminate the spike protein by transmitting them
through exosomes. The exosomes are picked up by microglia, immune cells in your
brain, which activate an inflammatory response, which can contribute to degenerative
brain disorders.

* Two microRNAs, miR-148a and miR-590, are central in this process. These microRNAs
— excreted in the exosomes along with the spike protein — significantly disrupt the type-
1 interferon response in any cell, including immune cells.

* On average, there are twice as many reports of cancer following the COVID shots
compared to all other vaccines combined over the last 31 years.

* The fact that the signal is that strong is even more remarkable when you consider that
most people don't think the COVID shot could be a variable in their cancer emergence, so
they never report it.

Sincerely,

Theresa Lane – Concerned WA parent

The oath you took includes the upholding of there laws.

Vaccine requirements should never include an experimental gene altering injection.

We now know that the COVID injections inflict great harm on children. Can you live with that on your conscience?

18 USC 241: Conspiracy against rights:

If two or more persons conspire to injure, oppress, threaten, or intimidate any person in any State, Territory, Commonwealth, Possession, or District in the free exercise or enjoyment of any right or privilege secured to him by the Constitution or laws of the United States, or because of his having so exercised the same; or

If two or more persons go in disguise on the highway, or on the premises of another, with intent to prevent or hinder his free exercise or enjoyment of any right or privilege so secured-

They shall be fined under this title or imprisoned not more than ten years, or both; and if death results from the acts committed in violation of this section or if such acts include kidnapping or an attempt to kidnap, aggravated sexual abuse or an attempt to commit aggravated sexual abuse, or an attempt to kill, they shall be fined under this title or imprisoned for any term of years or for life, or both, or may be sentenced to death.

18 USC 242: Deprivation of rights under color of law:

Whoever, under color of any law, statute, ordinance, regulation, or custom, willfully subjects any person in any State, Territory, Commonwealth, Possession, or District to the deprivation of any rights, privileges, or immunities secured or protected by the Constitution or laws of the United States, or to different punishments, pains, or penalties, on account of such person being an alien, or by reason of his color, or race, than are prescribed for the punishment of citizens, shall be fined under this title or imprisoned not more than one year, or both; and if bodily injury results from the acts committed in violation of this section or if such acts include the use, attempted use, or threatened use of a dangerous weapon, explosives, or fire, shall be fined under this title or imprisoned not more than ten years, or both; and if death results from the acts committed in

violation of this section or if such acts include kidnapping or an attempt to kidnap, aggravated sexual abuse, or an attempt to commit aggravated sexual abuse, or an attempt to kill, shall be fined under this title, or imprisoned for any term of years or for life, or both, or may be sentenced to death.

Subject: COVID shot

External Email

To whom it may concern,

I've just learned that the Technical Advisory Group is meeting to discuss the possible requirement of the Covid shot for children to attend school. I am adamantly against this requirement for many reasons.

First, our children are NOT dying of this virus. The survival rate is incredibly good for children across the board. Also, as shown the shot does little good in actually protecting our children from getting or spreading this virus so should have no bearing on their wellness. At this point I'm far more concerned with my children's social, emotional and developmental health; all of which have taken a hit during these mandates and pandemic lockdowns our state has implemented.

Second, as a parent of two children in elementary school, I cannot fathom putting something into their little bodies that has zero published data or papers on the effectiveness or side effects of this shot on K-12 children. Many of these studies are still being completed and I will not allow my children to be an experiment.

Finally, as this virus has mutated several times already and the shots are constantly not able to keep up with the mutations, I'm not sure why we would think it a good idea to require this as it will become essential to get continual boosters and "updated" shots each year. Much like the flu vaccine.

I hope, as a board that has the best interests of our public health at heart, you would consider the many reasons our children should not be required this shot to attend school. Their education should never be put at risk by something that has shown its ineffectiveness time and time again.

Thank you for your time,

Jill T.

Please do NOT entertain thoughts of mandating COVID 19 vaccinations for anyone, let alone school students. There are non-pharmacological treatments available for this disease, but there have been no long term studies on students for vaccines. You do NOT want to find out that you caused the deaths or injuries of thousands of children if they discover the vaccines are detrimental!!!

Hello Board Members,
As a high school English teacher in Monroe, WA I can tell you that many of my students are hanging on by a thread due to all the shutdowns, online schooling, and mask requirements. If you require vaccinations that will likely be the last straw for many of my students. They'll drop out and try to get jobs instead of putting up with one more roadblock to their education.

If you care about kids, don't be the cause of many of them leaving school in exasperation!

Subject: Covid and Mandates

External Email

To Whom This May Concern,

Thank you for your time and consideration reviewing my email. I write to you as a concerned parent and citizen as we continue down a strange Covid Policy path that is leading to a dark forest of unknowns.

At this current writing I ask that you take a look around the globe and see what is happening everywhere from Canada to New Zealand. In Canada tens of thousands of people (truckers and citizens) are at the capital refusing to leave because of mandates. In Australia they are not allowing unvaccinated people to participate in society as normal as well as a new policy that won't allow you to visit your child in a hospital unless you are vaccinated. In Washington State you can't go to your favorite restaurant any longer if you are not vaccinated, in some parts of the state you can't go into a public setting without revealing your private health status and showing your vax pass. In Austria they are starting to enforce mandatory vaccination and have press releases stating they will be going door to door with hired personnel. In the U.S. people are losing their jobs for not being vaccinated under the guise of the health policy that protected (vaccinated) folks are at risk of catching covid from unvaccinated folks, so we have to fire them because the protection some received isn't good enough to prevent them from getting sick from those who haven't received it? You can't even make sense out of what the policy is supposed to do? There is no logic here.

Around the world people are protesting these Covid mandates and passes, they are tired, they are scared (not of covid), they are extremely pissed off, and they all protesting for the same reason. Heavy handed mandates and Covid policy is not working and it is taking away freedoms from society as a whole and destroying their families. No one is out here protesting for more masking, more policy, more vaccination, or more bureaucratic assistance. It is effectively time to step away from trying to help and let people live their lives again. Everyone and I mean everyone is over the Covid period in history. There is no reasonable means for a state of emergency or mandates any longer. We have exhausted every tool and reasonable policy and have not changed anything over the course of Covid or the outcomes for 3 years. We have however effectively destroyed careers, lives, families, childhood development, traditions, societal norms, culture, businesses, etc. and continue to press harder, why?

The government and reputable sourced and peer reviewed data tells us only comorbidity sick or elderly folks are at high risk. The data tells us children aren't at risk, never have been. The data tells us hospitals aren't treating it correctly as more people die with covid at the hospital than at home. The data tells us the kitchen sink approach to defeating covid hasn't slowed the spread or stopped Covid. What are we doing? Is the risk of Covid spread greater than societal destruction and our children itself? The CDC's own data suggests 99% of folks survive covid, and that was before vaccinations were even available.

Today a study came out from the respectable and highly credentialed John Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise, you can read it here. <https://sites.krieger.jhu.edu/iae/files/2022/01/A-Literature-Review-and-Meta-Analysis-of-the-Effects-of-Lockdowns-on-COVID-19-Mortality.pdf>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fsites.krieger.jhu.edu%2Fiae%2FfiLiterature-Review-and-Meta-Analysis-of-the-Effects-of-Lockdowns-on-COVID-19-Mortality.pdf&data=04%7C01%7CWSBOH%40sboh.wa.gov%7Cffb79926b9d34d430a7e08d9e5d76f8b%7C>. I'm not sure how much more data we need to prove that public health approach didn't work for multiple reasons, one of which is denial of effective treatments at all stages.

The study is frightening and thorough in highlighting the destruction of last years lockdowns and continued mitigation efforts today. The impact it has had on society, children, business, etc. is heartbreaking and unjustifiable. This needs to stop now.

Another study here, <https://brownstone.org/articles/a-partial-list-of-the-myrriad-abuses-that-facemasks-inflict-on-our-children/>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fbrownstone.org%2Farticles%2Fa-partial-list-of-the-myrriad-abuses-that-facemasks-inflict-on-our-children%2F&data=04%7C01%7CWSBOH%40sboh.wa.gov%7Cffb79926b9d34d430a7e08d9e5d76f8b%7C> highlighting just some of the abuses that Facemasks have inflicted on our children. This article is heart wrenching and leaves one disgusted. Our leaders should be ashamed of themselves. These kids cannot go on living like this, people in general cannot go on living like this. The continued Covid policies affect the poorest families, minorities, and our most fragile citizenry the hardest. For a governor and state majority who is majority liberal by voting numbers constantly touting diversity and inclusion, unity etc. these policies are the exact opposite. Our leaders have lost their way as Americans, we are using top down policy approaches that are destroying commerce and unity amongst the very people they were elected to support.

When does it end? Where does it end? What are we doing? Folks have lost so much faith in government, schools, leaders, boards, institutions, you name it. People and I mean 99% of people just want their lives back and the policies are now preventing this from happening. The children of the world are being abused by these policies, this is not acceptable. No one wants to continue down these path's. We have had ample time for folks to get shots, get healthy, take measures, etc to prevent themselves from getting severe Covid. Those who haven't or choose not to are not going to now by taking more of their freedoms away. They will just fight harder, speak louder, and get more bold in their actions. You will create more division, more hate, and more destruction. Is the Washington State Board of Health and our Government officials going to take responsibility for this?

Natural Immunity is the answer to solving covid but we cannot even recognize it in this country, why? Natural covid immunity stands for nothing, why? This goes against all science and progress we have made throughout history and it is effectively undermining your own policy and respect for governing. Everyone knows natural immunity reigns supreme and the more folks out in society with it the better. But yet we continue to mask and mandate and dampen the affect natural immunity would have at helping resolve this quicker?

Please for the love of society and all things right in your stomach and hearts stop with the overreaching heavy handed policy. Listen to your gut. We are not operating with compassion here. Stop with the mandating of vaccines for kids in schools, there is no logic, no data, and no reasonable outcome for this policy to even be discussed. If there is data available then be transparent, justify it, display it, don't allow this to continue down tyrannical and draconian paths of dystopia. Parents are not happy about this. We don't require FLU shots every year for schools, why require for covid? What is it doing to people that is so justifiable that we must enforce or support mandatory vaccination especially for the children? Why is covid so scary to people, is it because of the non stop social media and messaging campaigns?

Thank you for your support. NO MANDATES NO MASKS NO MORE NOW!

Sincerely,

A compassionate and reasonable citizen.

Subject: Local Official Responses to Health in Spokane Cty

External Email

I write for guidance on how I can have impact on the below. Alternatively, I hope DOH is aware and engaged re: how aberrant Spokane's city and county approach has become to health, particularly pandemic responses.

The below link includes information on the most recent chapter of many following the firing of Dr. Lutz in Spokane Cty. and officials' efforts to avoid conventional health response in Spokane City and County. It is fruitless to contact the Commissioners (or—one the city side--the Mayor regarding her lack of engagement with compliance, such as re: City Council member Bingle, who refuses to wear a mask. The mayor distances herself from his censure, leaving the city attorney act as a policy maker, another departure from norms). It is quite possibly unsafe to raise issues at meetings, given incidents at various public forums in the area. Of course, masking isn't enforced here, with even some official offices (e.g., sheriff offices, for example) openly opposing masking and leading to increasing radicalism of those who oppose the mandates. All very discouraging . . .

<https://www.spokesman.com/stories/2022/feb/01/spokane-county-commissioners-could-pick-a-naturopa/>
<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.spokesman.com%2Fstories%2Fspokane-county-commissioners-could-pick-a-naturopa%2F&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Cbce00054ba4844bd437908d9e5bf7204%7C>>

I recognize there are limits to what DOH can do. Many of us miss the days of Dr. Lutz and conventional, trusted health responses to pandemic and other social/health issues. At least then the regional health district and commissioners had a voice of reason to which to listen. Now, they are walking such a different path and I fear increasingly for health in our area.

I am weighing in on the 2 agenda questions. #5: does the vaccine prevent disease? Definitely not. It has no effectiveness on Omicron or Delta. It was only effective on the original strain of Covid. As a matter of fact, now it seems to infect the fully vaccinated more.

#6: Does the vaccine reduce the risk of person-to-person spread: Absolutely not. See above. If it does not prevent the disease then it will not reduce person-to-person spread. It might even accelerate it.

Subject: Mandatory Vaccines for our Children in WA State

External Email

To the TAG Team,

Vaccine Mandates are ILLEGAL, UNCONSTITUTIONAL AND A CRIME AGAINST OUR CHILDREN.

This Injection was Mandated under an Emergency Use Authorization. It is Not approved by the FDA. It is an Experimental

Drug, not a Vaccine. If you want to be part of this experiment, that is your choice. But this must ALWAYS be a personal, private choice for

Every Parent and Human Being, when there is risk of Death or Injury.

When it comes to our CHILDREN, this is where WE the PARENTS and THE PEOPLE DRAW THE LINE IN THE SAND.

People are DROPPING DEAD from this KILL SHOT WORLD WIDE. Of course, you will not hear about this in mainstream media, which is controlled

by the Pharmaceutical Industry. They have censored all the victims.

Any forced injection on a human being, is no different than rape. This is a murderous crime against our children! Covid death for children is 0 percent!

Have you forgotten the Nuremberg Code? OUR CHILDREN ARE NOT YOUR PROPERTY!! MEDICAL FREEDOM IS A GOD GIVEN RIGHT!! THIS IS A WAR AGAINST OUR GOD!

GOD did not make a mistake when he made our Miraculous Immune Systems, if we only take care of them properly.

If you aren't on the side of GOD, THEN WHO'S SIDE ARE YOU ON? THIS IS GOOD AGAINST EVIL AND YOUR PARTICIPATION IN THIS MANDATED INJECTION, IS EVIL

TO THE CORE. MANY CHILDREN WILL DIE AND BE INJURED FOR LIFE, FROM THIS INJECTION.... AND IT WILL BE BY THE HANDS OF YOU TAG TEAM!!!

THIS IS AN UNCONSTITUTIONAL ACT AND WE WILL NEVER COMPLY!!!! LIBERTY IS A GIFT FROM GOD, NOT MAN.

STAND UP AGAINST MEDICAL TYRANNY, WHILE YOU STILL CAN, BEFORE IT'S TOO LATE, AND YOU WITNESS YOUNG, INNOCENT, CHILDREN BEING MURDERED IN FRONT OF YOUR EYES

BY THIS KILL SHOT!!!

YOU WILL BE HELD ACCOUNTABLE!!!!!! EVERY ONE OF YOU.... BEFORE YOUR GOD!!! AND MAN!!!

Dear Mr. Glasoe,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

Why are we pushing the vaccine requirement for COVID-19 when the child mortality rate due to COVID is so low our children have NEVER been required to submit to an annual vaccine.

With childhood deaths being so low why is this even being considered....

I will pull my all my children from their school's if this is the case

All I see for this COVID vaccine requirement in schools is DEPRIVING CHILDREN OF A PROPER EDUCATION.

The flu shot has never been required neither should the COVID shot.

My family and I have all had COVID and it's came and gone just like a slightly tougher cold/flu combination as with any virus as long as you stay hydrated, eat healthy foods and sanitize your home it shall pass.

I hope my letter is met & considered with all sincerity,

I am absolutely opposed to approving or mandating shots for children of ANY AGE! Show us the need for such mandates!! Show us that no harm will result from the shots to the children!!! Authorities who advocate or legislate such measures will be prosecuted to the fullest extent possible in the world courts. Please think twice before passing such totalitarian rules!

Thank you!

Debby

Please accept the attached letter as a public record opposing the COVID 19 "vaccine" for K-12.

Thank you.

THE NUREMBERG CODE

1. The voluntary consent of the human subject is absolutely essential.

This means that the person involved should have legal capacity to give consent; should be so situated as to be able to exercise free power of choice, without the intervention of any element of force, fraud, deceit, duress, over-reaching, or other ulterior form of constraint or coercion; and should have sufficient knowledge and comprehension of the elements of the subject matter involved, as to enable him to make an understanding and enlightened decision. This latter element requires that, before the acceptance of an affirmative decision by the experimental subject, there should be made known to him the nature, duration, and purpose of the experiment; the method and means by which it is to be conducted; all inconveniences and hazards reasonably to be expected; and the effects upon his health or person, which may possibly come from his participation in the experiment.

The duty and responsibility for ascertaining the quality of the consent rests upon each individual who initiates, directs or engages in the experiment. It is a personal duty and responsibility which may not be delegated to another with impunity.

2. The experiment should be such as to yield fruitful results for the good of society, unprocurable by other methods or means of study, and not random and unnecessary in nature.
3. The experiment should be so designed and based on the results of animal experimentation and a knowledge of the natural history of the disease or other problem under study, that the anticipated results will justify the performance of the experiment.
4. The experiment should be so conducted as to avoid all unnecessary physical and mental suffering and injury.
5. No experiment should be conducted, where there is an a priori reason to believe that death or disabling injury will occur; except, perhaps, in those experiments where the experimental physicians also serve as subjects.
6. The degree of risk to be taken should never exceed that determined by the humanitarian importance of the problem to be solved by the experiment.
7. Proper preparations should be made and adequate facilities provided to protect the experimental subject against even remote possibilities of injury, disability, or death.
8. The experiment should be conducted only by scientifically qualified persons. The highest degree of skill and care should be required through all stages of the experiment of those who conduct or engage in the experiment.
9. During the course of the experiment, the human subject should be at liberty to bring the experiment to an end, if he has reached the physical or mental state, where continuation of the experiment seemed to him to be impossible.
10. During the course of the experiment, the scientist in charge must be prepared to terminate the experiment at any stage, if he has probable cause to believe, in the exercise of the good faith, superior skill and careful judgement required of him, that a continuation of the experiment is likely to result in injury, disability, or death to the experimental subject.

Re: Washington State Board of Health
Technical Advisory Group
Comments to Public Meeting
Agenda Items # 5 & 7 – Review of Criteria 5 & 6

To Technical Advisory Group (TAG):

The experimental COVID “vaccines” do not meet Criteria numbers: 2, 4, 5, 6, & 7, of the "Criteria for Reviewing Antigens for Potential Inclusion in WAC 246-105-030" (CRAPI). Science and children’s inherent immunities do not support the implementation of COVID “vaccines” for K-12. It is beyond understanding why it is taking so long to deliberate something that is as straightforward as this. COVID “vaccines” absolutely, irrefutably, unconditionally do not meet the Criteria under discussion today, nor did they meet the Criteria under discussion at the last public TAG meeting.

But let’s focus on what is in today’s Agenda:

Criteria 2 - *“The vaccine containing this antigen is effective as measured by immunogenicity...”* **False:** The COVID "vaccine" should not be considered a vaccine because it is not effective at PREVENTING transmission of the disease, so says the Director of the CDC.¹

Criteria 4 - *“Experience to date with the vaccine containing this antigen demonstrates that it is safe and has an acceptable level of side effects.”* **False:** The COVID "vaccines" have passed the one-million mark for adverse effects. For the negative effects on children, please see attached data spreadsheet “Attachment A - VAERS Report Children 5 – 11,” (an excerpt from the VAERS data report for 2021)². The report is shocking and illuminating in that many “accidents” are reported as occurring as a result of the administration of the shot, thus making the jab by untrained personnel almost as dangerous as the “vaccine”. Also in this report are the suicides; sixty-six children, ages 5-11, committed suicide in 2021, their deaths counted as COVID.

Why is TAG and BOH taking such unnecessary risks with our children when our children are not in danger of dying from the disease,³ or of experiencing much more than flu like symptoms?⁴ That’s the million-dollar question: WHY ARE YOU DOING THIS TO OUR CHILDREN?

How many members of the Technical Advisory Group adopt science based, critical thinking in your decision making? Have any of you carried out any research into alternatives to the “vaccine”? (It is estimated that 500,000 people have died in the last eighteen months because they were denied (by Fauci) preventative

¹ <https://www.msn.com/en-us/health/medical/cdc-director-covid-vaccines-cant-prevent-transmission-anymore/ar-AASDndg>

² <https://vaers.hhs.gov/data.html>

³ <https://petition-central.com/new-data-covid-was-never-more-dangerous-to-young-adults-and-children-than-seasonal-flu/>

⁴ <https://www.newsweek.com/risk-kids-covid-miniscule-do-not-let-them-mandate-vaccines-opinion-1638576>

treatments like Ivermectin and hydroxychloroquine.)⁵ How many in this Group have conducted research into the corrupt and sociopathic practices of Anthony Fauci and Bill Gates, amongst others? (Gates, Fauci and other world leaders are currently being investigated in preparation to present before a Grand Jury, in an International Court for Crimes Against Humanity.^{6 7}

Fact, every doctor, nurse, health care worker, politician, educator, and others in positions of power that promotes the COVID “vaccine” as the ONLY effective treatment against COVID is guilty of Crimes Against Humanity under the Nuremberg Code. Mandating this “vaccine” breaks not one but every one of the ten “crimes” under the Nuremberg Code (Attachment B). Current scientific studies do not support you and your position in the Technical Advisory Group will not protect you if you approve this “vaccine” for children.

On Thursday, February 10, 2022, you will be deciding the future of the children of the State of Washington—will 99.996% of them live if they get COVID or will some of them die unnecessarily from the “vaccines” adverse effects? That’s not a question asked for dramatic impact. Your recommendation to Washington State Board of Health holds weight and children’s lives are dependent upon you doing the right thing by them. And let’s be clear, to say that parents can opt out of the “vaccine” is as hollow as proclaiming the rest of us have that luxury. Two years of draconian mandates have declared otherwise.

Your recommendation to BOH should be a resounding **NO to the COVID “vaccine” K-12 mandate.**

Sincerely,

Gayle Baker

WAC 246-100-040

Opinion Regarding Procedures for isolation or quarantine.

I find it terrifying to see this happening in our state. It effectively removes our civil and constitutional rights. There is a name for it, a dictatorship. I see us moving toward the same horrors that are happening in Israel, Australia, Austria, and China.

This WAC allows the health department to be judge, jury and executioner base on “their” opinion and assessment? Who should have that amount of power over another individual? No one. What makes the employees of the health department so superior that they know what is best for another person?

I would not want to be the individual making decisions listed in this WAC. I would not even want to know the person who could justify taking the actions listed in this WAC. What is the moral and ethical character of the employee/enforcers? The only persons who could do such work must have a personality that is sociopathic and not with conscience. This can only lead to abuses. It has happened in the past many times.

10 stages of Genocide- Perhaps this will be a good reminder of the slippery slope we are on. I believe we are in stage #7 of this genocide and moving towards #8. Please review and maybe you can dismiss this in your own mind, and justify the actions listed in the WAC as just, “Protecting the population.” Nothing like being the “Good German.”

Dr. Gregory H. Stanton is Research Professor in Genocide Studies and Prevention at the Institute for Conflict Analysis and Resolution, George Mason University, Arlington, Virginia.

1. Classification: People divided into “Us” and “Them”
2. Symbolization: People are forced to identify themselves.
3. Discrimination: People begin to face systemic discrimination.
4. Dehumanization: People equated to disease, vermin, and animals
5. Organization: Government creates special groups to enforce the policies i.e. “Strike team” or police/military.
6. Polarization: Government broadcasts propaganda to turn the populace against the group.
7. Preparation: Official action to remove/relocate people begin.
8. Persecution: Beginnings of murder, theft of property, trials, massacres.
9. Exterminations: Wholesale elimination of the group. It is extermination and not murder because the group is not thought of as human.
10. Denial: The government denies it has created any crimes.

The verbiage of this WAC is vague. What will the criteria be for a health official to issue an emergency detention order? Will it be because the person or persons refuse to take a vaccine? Will it be because they have cold and flu symptoms? Gosh, I have had many of those. Maybe an elevated temp? Will it be because I write a letter against the CDC or FDA? What if I inform others about VEARS, that 21,000 people died because of the vaccine, which only represents 1% of the actual number reported (according to Harvard) or the 1,000,000 who have been injured? Will parents who refuse to vaccinate their children be vilified and the children taken away? There is plenty of words to describe the legal this and legal that, and we all know what a nightmare that would be. Nothing like being placed in a concentration camp or whatever nice word you wish to call it without representation, without committing a crime. Who will be helping the people who are being harassed and terrorized by these health officials? Who will be liable for damages done to people? Emotional trauma, financial loss, physical harm due to forced treatment, no one wants to be liable for the damages they cause. This will equal a crime against humanity and those who participate will be guilty.

This is a pathetic power grab and has nothing to do with public health. ***Dictatorship***, form of government in which one person or a small group possesses absolute power without effective constitutional limitations. There should never, ever, be that much power given to an individual or agency based only on sole discretion.

Please do not mandate Covid 19 vaccines for children to attend public or private school. Children have robust immune system's. Currently there is no published literature on pediatric Covid-19 vaccine effectiveness in K-12 school setting. In addition, Covid -19 is not life threatening to children as seen in the data. Suicide is the 3rd leading cause of death among children 15 to 19. The effects that this vaccine can have on children is more detrimental to them and their overall health than contracting COVID-19. Parents and families should have the right to make decisions regarding what is being put into their children's bodies that might affect them or harm them. These COVID-19 vaccines do not have enough data to prove beneficial. And we do not have long-term studies to show that they are more beneficial then harmful. Please vote no on mandating COVID-19 vaccinations for children.

A concerned parent,
Heather Clerget

Hello,
☐

I am opposed to making COVID-19 shots mandatory for school admission or childcare in our State for the following Reasons:

A)

"15,000 physicians and medical scientists around the world signed a declaration publicly declaring that healthy children should NOT be vaccinated for COVID-19. On behalf of these MDs and PhDs, Dr. Robert Malone, who has devoted his career to vaccine development, provides parents a clear statement outlining the scientific facts behind this decision."

<https://globalcovidsymposium.org/news/live-stream-event-physicians-alerting-parents>

B)

"The vaccines are associated with higher rates of COVID-19 infections and higher rates of COVID-related deaths. In the US, the vaccines were associated with an increase of 38% in the number of COVID cases per million and an increase of 31% in the number of deaths per millions associated with COVID."

<https://stevekirsch.substack.com/p/new-big-data-study-of-145-countries?r=u75lc>
<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fstevekirsch.substack.com%2Fp%2Fnew-big-data-study-of-145-countries%3Fr%3Du75lc&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C093a77a70ccb400b9ac508d9e2>>

C)

Nobel Prize Winner Dr. Luc Montagnier: Omicron Makes Biden's Vaccine Mandates Obsolete

"It would be irrational, legally indefensible and contrary to the public interest for government to mandate vaccines absent any evidence that the vaccines are effective in stopping the spread of the pathogen they target. Yet that's exactly what's happening

here.”

<https://www.wsj.com/articles/omicron-makes-bidens-vaccine-mandates-obsolete-covid-healthcare-osh-evidence-supreme-court-11641760009>

I could go on and on with more data and information similar to the above, but we all know and have all experienced the fact that people who are vaccinated are still getting sick and are still spreading the virus. There is absolutely no reason for any mandates when this vaccine cannot stop the spread or prevent a person from contracting covid.

We implore you to reconsider any vaccine mandates.

Regards,

Ingrid and Randy DeHaan

January 25, 2022

To: Technical Advisory Group (TAG) on Immunization, Washington State Board of Health Members

Subject: SARS-CoV2 Vaccine Consideration for School-Aged Children

RECD
JAN 28, 2022

I am a parent of three children.

I do not believe our current SARS-CoV2 vaccines meet criteria #6 of the nine criteria outlined in the document titled *Immunization Advisory Committee: Criteria for Reviewing Antigens for Potential Inclusion in WAC 246-105-030 updated November 8, 2017*.

Dr. Anthony S. Fauci co-authored an article on December 15, 2021 for The New England Journal of Medicine titled 'Universal Coronavirus Vaccines—An Urgent Need'. This article states, "The limitations of SARS-CoV2 vaccines suggest that they will ultimately need to be replaced by second-generation vaccines that induce more broadly protective and more durable immunity." Dr. Fauci is already moving past our first-generation vaccines.

The high infection rate in our communities supports that the SARS-CoV2 vaccines will need to be replaced. They are not providing much, if any, reduced person-to-person transmission or durability.

We should not rush to include Emergency Use Authorized (EUA) products to our immunization schedule.

Lastly, the document *Immunization Advisory Committee: Criteria for Reviewing Antigens for Potential Inclusion in WAC 246-105-030 updated November 8, 2017* lacks criteria for the removal of antigens. By only including reasons an antigen should be added to the vaccine schedule and not why antigens should be removed, the committee is narrowly focused on addition and may overlook the bigger picture. What is the cumulative effect of adding vaccines? What are the interactions when administering multiple vaccines at one time? When is a vaccine out of date and no longer a good match? What are the limits when stimulating the immune system with antigens?

Please understand, my children followed the vaccine schedule. I was vaccinated with the SARS-CoV2 vaccine. But the SARS-CoV2 vaccine has left me with more questions than answers about all vaccines.

For these reasons, I do not support adding SARS-CoV2 to the vaccine schedule.

Dear WA State BOH & Marysville School District,

Please review the attached video of a Senate hearing. You should look up & watch the full hearing. You should consider this information & new information coming out when making your decisions & policies moving forward.

Government bureaucrats will be held accountable for crimes against humanity & the Nuremberg codes.

I would strongly advise you not to ignore the information coming out.

Sincerely,

#WeThePeople & Parents of our children.

Subject: School Covid vaccine - YES!

External Email

I'm writing to share my opinion on the school vaccine requirement. I understand there is a request for those opposed to email you so I wanted to share that I feel this Covid vaccine is no different than any other vaccine required to attend a PUBLIC school. I am all for vaccines, believe in the science and want my kids to be protected from all the preventable diseases that vaccines protect them from, including a severe case of covid.

Those who do not wish to vaccinate against any of the preventable diseases have the right to home school or start a commune. Let's stop politicizing a virus and if that's not possible, I feel Polio needs a launch a PR campaign because I haven't heard that any side has claimed that one as theirs yet.

Jenn Martin – parent of two kids in the Snoqualmie Valley School District

Subject: Comments for the Immunizations Technical Advisory Group

External Email

As my highly educated friend stated, and I agree: "This is a hard NO from me as there is zero reason to recommend the covid injections for our children (or anyone for that matter). These injections do not limit transmission nor are they limiting hospitalizations over-all (adjusted for health-bias) to those at most risk. Not to mention, as of January 28, 2022 there are over 23,000 COVID19 Vaccine-related DEATHS, and over 1,000,000 COVID19 vaccine confirmed injuries. Additionally, most of us are already covid-recovered and there is clear evidence acquired immunity is the gold standard (as it has always been) with more robust and durable immunity than any AB found post vaccine. The vaccines are waning after 2 months and worthless after 6 months. SARS-COV2 is not a disease of the young. The innate immunity of young people destroys COVID19 in all variants. To even consider these injections as recommended for our young people displays gross negligence on behalf of this advisory group. This group should be dissolved immediately and issue a public statement as to the NON RECOMMENDATION for any consideration of these dangerous injections for our children. Anyone who gives their child this injection is indeed risking their child's health and well being and very life. Whereas covid infection, disease and recovery is nearly ZERO risk comparatively."

I am personally covid-recovered as well as my husband and 3 children and we all have natural immunity and I will share our covid story with you: I was personally infected with Covid-19 in late January 2021, over 1 year ago, but the rest of my household did not become infected at all during my illness. They themselves did not contract the virus until late August/early September of 2021 (another variant I assume) and they all recovered with no problems. Incidentally, I took care of each one of them, one after the other in a 3- 4 week span of time, I never quarantined away from them and actually continued to be in close proximity to them as a mother would take care of their children and husband if they were infected with any other virus, and guess what? I NEVER GOT REINFECTED! I share this with you because that is a BIG WIN for the human body's ability to fight off infections and I am living proof! My natural immunity protected me considerably and more efficiently than any lab created test injection. (I will not even lie and address these toxic injections as a "vaccine".) These trial injections are not tested per the usual government standards or regulations and are not proven safe or effective and in fact have proven to be ineffective and dangerous to the human body. I will never go along with anyone playing "russian roulette" with my children's lives! Stop the insanity and please say no to any COVID 19 vaccine requirement for our children!!! It is NOT SAFE, NOT EFFECTIVE AND COMPLETELY UNNECESSARY!

To whom it may concern,

I am writing to voice my concerns regarding the upcoming vote to require a covid vaccine for children to attend school.

Over the last two years, public school attendance has dwindled, while homeschool and private school numbers are increasing. How much of that is because of new mandates from Corona fears? Is forcing another vaccine really worth jeopardizing the funding of public education now and in the future?

Please keep in mind that this is not a long term safety tested cure all, it is still a new vaccine; heart attacks have been on the rise in a younger population and is there a link? Nobody knows because there has not been enough time to test long term side effects of this vaccine. Are you really willing to use our children as guinea pigs?

Furthermore, people who are up to date still catch and spread Covid-19. In most people covid presents itself as a cold or mild flu symptoms. Most people do not die or have long term difficulties from this minor infection. How is requiring a vaccine going to change that? It won't!

The covid shot should absolutely not be mandatory for school age children, please remember your duty to encourage personal responsibility and uphold freedom of choice, as well as bodily autonomy. Please do not risk driving more families away from public education by voting on the side of control with fear and misinformation as your motivation.

Sincerely,
Leah Dowd

This is the recent interview from Dr. Meissner. We will not comply to harm our children to attend school.

Dr Cody Meissner, the chief of pediatrics at Tufts Children's Hospital in Boston and a member of the FDA's Vaccines and Related Biological Products Advisory Committee (VRBPAC), doubted whether the vaccine is needed for group which already suffers such low risk of hospitalization or death from Covid.

'I think we're rethinking the way we looked at this question, because even though people are appropriately vaccinated they are still able to become infected and transmit the virus to susceptible people around them,' Meissner told DailyMail.com.

'So this is a little bit different than many other infectious diseases such as measles, or mumps, or rubella. If you're protected from infection with the vaccine, then you're not going to transmit it to other people.'

'But that's not the same setting with [this virus].'

Good Morning-

I have emailed before and I will continue to email you until you stop this insanity! Once again , these are not vaccines! Unless you are trying to kill our children why would you give this shot to our children! The recovery rate for children from COVID is over 99%! My kids have had it twice and have had minor sore throat for less than 24hours and a cold! Do NOT mandate a shot that is unnecessary and unsafe!!

Subject: Local control to lift mask mandates

External Email

Dear Mr. Thai,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

Please look at the data carefully before you impose an experimental injection on our children that could have potential negative effects on their long term health. These injections don't prevent the transmission of Covid or protect one from getting it. Children are at minimal risk of having a serious illness unless they have comorbidities. There have been minimal deaths in children. The risk to them outweigh the benefits. This injection doesn't meet the qualifications for making it mandatory. I listened to your first zoom which gave clear indications that it didn't. Thankyou for your time.

Subject: No to adding the COVID shot to the schedule for children

External Email

Dear health decision makers,

I am writing to you as a concerned parent. Please do not vote to add the COVID vaccine to children's vaccination schedule. I find it very concerning that you are even considering adding this as we are nearing the endemic stage of this virus. The COVID vaccine does not get rid of COVID. Children are at the least likely to have severe side effects from COVID and are much more likely to have side effects to the vaccine. In Germany there was a study of 100,000 unvaccinated children who contracted COVID. 8 of those 100,000 ended up in ICU and none died.

On a personal note, I am not anti vaccine and I got the COVID vaccine myself. However, after my reaction to the vaccine, I cannot in good conscience let my children receive it. I had every side effect from the vaccine. I was sick for 5 days and half of my face went numb. My niece got the COVID vaccine and her face swelled up. My close friend received the Vaccine a year ago. She is still having side effects from the vaccine. She had/has heart inflammation and ringing in her ears. My hairdresser had blood clots after the vaccine. The worst side effect was my sister's friend's husband who died from the vaccine. I know COVID is severe, but I was fortunate enough to not know anyone who has died or been hospitalized from COVID. However, from my list above I do know people who have been harmed by the vaccine and these are just the ones I listed.

When the vaccine does not stop the spread of the virus, and we still have to social distance, and we still must wear masks, and we still might end up in the Hospital, why would you think we would agree to vaccinating our children who are the least at risk of COVID? If this vaccine becomes mandatory for my kids to attend school, I will be pulling them from public school and will homeschool them!

Please do the right thing and vote no on requiring this vaccine for school children!

Best regards,

Sarah Darboe

To whom it may concern,

As a parent of school age children in Washington State, I would like to respectfully request that you consider a couple of items as you decide if the COVID-19 vaccine should be added to required school immunizations.

First, according to statistics on the CDC website, schoolchildren have a very low risk of death due to COVID-19. There were 683 deaths from the disease in the group aged 5-17. At the same time, there are approximately 56.4 million school age children in the US, meaning a child in school has a .00012% chance of death from the virus.

Second, there have been adverse reactions to the vaccine, which is new technology. VAERS reports 43 deaths and 1,715 hospitalizations for 7,141,428 reported vaccinations. The risk of death from the vaccine (.0006%) is higher than the risk of death from the disease! Moreover, the vaccine has not been shown to prevent the disease or even reduce transmission, so rather than decrease the risk associated, it actually increases the total risk.

In conclusion, I do not believe this vaccine is a benefit to children in this age range and instead of decreasing risk it actually increases the total risk to the child's health. For this reason, I hope to hear that you have decided not to include it in the required school immunization list.

Thank you for your time and consideration.

Sincerely,

Rod Colvin

Please enter your comments or questions in the space provided below:

I'm very concerned about a potential COVID-19 vaccine mandate for children entering school. Yesterday, I attended the Vaccine Advisory Committee meeting. This committee is very "pro-COVID-19 vaccine" and presented a lot of data. My concern is that they did NOT include granular data that could paint a different picture including comorbidities, being hospitalized "with" or "for" COVID, adverse side effects, etc. This data is critical to informing the public and gaining trust and credibility. I have taken many statistics courses and I know how easy it is to manipulate data to further a particular point of view. I am glad to see that others in my community are recognizing this as well. I understand that sharing more detailed information could unravel the story that the committee is trying to tell. The Vaccine Advisory Committee actually spent a lot of time talking about how they are going to approach marketing to the unvaccinated, which personally, made me cringe. I am not an Anti-Vax'r. My family is vaccinated, with all the usual vaccines recommended for school age children. My family had COVID a few weeks ago and we are fine. I believe that the COVID-19 vaccine should be a personal choice, just like the flu shot. Each person needs to consider their own situation and health profile because, like it or not, a health profile matters a lot if you break out the data. According to the CDC, 75% of COVID-19 deaths were from people with 4 or more comorbidities. I don't believe that this vaccine is a "one-size-fits-all." My family will NOT be getting a COVID-19 vaccine, unless I see more data that convinces me that we really need it. Each person is unique and needs to weigh the pro's and con's with their physician. It is clear to me that the Vaccine Advisory Committee has an agenda. People are beginning to see through this. If this committee really wants to gain the trust of the unvaccinated they need to be willing to have an open conversation with physicians who have other opinions. My concern, and the reason that I am writing, is that by April, my families' choices will be limited because many private schools and alternative schools, will have already gone through their open enrollment phase for the following school year. As you are probably aware, within the last year, enrollment in Private schools and home schools have skyrocketed. Therefore, parents need time to make plans for their families. My husband and I have discussed the risks for our family and if we don't get a clear answer about this potential new requirement shortly, we will go ahead enroll in private school, which will allow for exemptions, without any weird singling out that could happen in public school. This way we can ensure that our children can get an exemption and we can move on with our lives. I think this is weighing heavy on a lot of parents. I think the Department of Health needs to recognize the bias of the Vaccine Advisory Committee and seek more public opinion. I have been in contact with my local School Board, and I hope that they will choose to seek public opinion as well.

You had better not do this. You've already done enough damage to our children.

This is beyond Orwellian.

We've had enough of your dictatorial power and will not allow it.

Shameful. Criminal. Idiotic. Wake the hell up!

I can't get a decent answer as to WHY we are in such a hurry to get children vaccinated....???

Lots of rumblings are coming out about the negative affects the shot has already had on children. And, these affects are not reversible. They are permanent. PLEASE WAIT....fully test it....put the children first....

Hello TAG board,

You cannot in your consciousness and available data add covid 19 to the required list of vaccines for children.

With 200x fold risk in myocarditis/pericarditis cases amongst young males and ZERO efficacy at preventing the spread you will knowingly put children's health at risk!

The vaccine is not approved for children and carries ZERO benefit to a healthy children and risk are by far outweigh any hypothetical benefit. There is ZERO long term studies on how it can affect children 3, 5, 10, years later.

Should the board approve adding CV19 vaccine to the list of vaccines required for school, the board will commit gross negligence against children.

Thanks,
Anna

1,104. If the risk of an adverse event is even close to this in kids under 5 years old, it doesn't make any sense to approve a vaccine in this age group when we have absolutely no evidence of benefit. Thus, the third criterion hasn't been satisfied.

Finally, we have the question of whether there are adequate, approved, and available alternative treatments. It's less clear how to answer this question for young children. But to a certain extent, it's a moot point because the Pfizer vaccine has already failed the first three of the four criteria that need to be met in order for an EUA to be approved.

Nevertheless, Pfizer has submitted an EUA application, and the FDA will review it on February 15. I cannot for the life of me understand how the FDA can review an EUA application when there are no data on the vaccine's efficacy to support the application!

This is incredibly disturbing. The FDA seems to be rushing to approve a completely unproven medical treatment for an age group that is at extremely low risk for the disease that product is intended to treat.

Where is the emergency? Why should this be rushed? We're talking about the health of our children here—and in this case, the health of our youngest and most vulnerable kids.

If the Pfizer vaccine is approved for kids under 5 years old, most parents will (understandably) assume that it has been shown to be effective and safe. That is not the case.

Aaron Siri (who has sued the FDA to force it to release the documents it relied on to approve the Pfizer EUA) has been writing about this issue, and I think this paragraph from one of his recent articles

>https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fcmq5z04.na1.hubspotlinks.com%

sums up the predicament we are in:

“Just look at this circus – the government mandates Pfizer’s product, gives it immunity for any safety or efficacy issues, promotes its product using taxpayer money, gives Pfizer over \$17 billion and then uses taxpayers’ money to fight to avoid providing even the most basic level of transparency to the public.”

This is not how science and medicine should work. We need more rigor, more transparency, and more oversight from the federal agencies that are supposed to play this role.

Subject: Health survey for requiring COVID vaccine for students

Hello, I just found out about the Health survey for requiring COVID vaccine for students in the State of Washington

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fsboh.wa.gov%2FNews%2FArticles-Surveys-Now-Available-Parents-and-Caregivers-Provide-Feedback-to-the-TAG-Responses-Accepted-Until-Wed-Feb-2&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C313974b1f4f74ed17bca08d9e73d202f%7C11d0e21726>>
and when I went to click on the links, it showed they were already closed.

It unfortunate there was such a low amount of responses that could be recorded and how little it was publicized to ensure it reached all parents. The schools send out vaccine clinic emails once a week but couldn't send one email asking for parents feedback for this forced mandate on a broad scale.

I strongly reject the idea of a vaccine mandate for school age children in the state of Washington. I live Bothell and my 7 year old attends the North Shore School District. With weekly testing the North Shore District has not had any major outbreaks. With weekly testing and proper remote school technology options in place, there is no need to risk kids life from having irreparable side effects.

I have been suffering from an adverse Pfizer vaccine reaction that has completely impacted my quality of life. I had no prior medical issues and now have daily neurological symptoms for which I am seeing 5 different doctors from neurologists, to immunologists, to holistic specialists for detox and 6 months later, I still have no relief after spending tens of thousands of dollars. I have reported it to VAERS, CDC and Pfizer and no one cares to help those injured from the vaccine.

I am not alone, there have been over 1MM adverse reactions reported to VAERs in the US alone. So many other countries are doing away with mandates and many colleges in the US have done so already.

If you enforce this mandate, you will thousands of parents pull the kids out from public schools which will greatly reduce you funding.

Please take this into have a proper survey via a proper survey tool to capture proper feedback.

Thank you for your consideration.

Jennifer Lazo

Subject: No to Covid-19 Coronavirus Immunization Criteria

External Email

Hello, Washington State Board of Health,

I am writing to you to request you not to put the Covid-19/or/Coronavirus (seasonal flue) Vaccination as a requirement for children to go to school in Washington State. You know that what you are requiring is against the constitution and against science. You know you are pushing this against people's will. You know the Covid-19 vaccine is not a true vaccine and it has caused many injuries in young people and killed many. And you are still pushing it for your own benefit!!!! "NO" to Crimes Against Humanity! Consider yourself served.

Vote NO on mandatory covid-19/coronavirus vaccination now and always.

DO NO HARM! Hipocratic Oath!!!

Subject: Oppose Vaccine Requirements

External Email

I am writing today to express my absolute opposition to implementation of a COVID 19 vaccine requirement for schools in Washington State.

1. No COVID vaccine available in the United States has received FDA approval. All available vaccines, including the Pfizer-BioNTech vaccine, are being administered under an Emergency Use Authorization. The only "approved" COVID 19 vaccine is Comirnaty, and it is not available in the United States and there is no anticipated date for its availability. This "smoke and mirrors" approach by the FDA is the subject of numerous lawsuits and a Federal Judge recently rejected Pfizer's claim that the 2 products are interchangeable: Federal Judge Rejects DOD Claim That Pfizer EUA and Comirnaty Vaccines Are 'Interchangeable' • Children's Health Defense (childrenshealthdefense.org <<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fchildrenshealthdefense.org%2F&da>) Since EUA products cannot be mandated per the Nuremberg Code, this alone should be enough to stop consideration of making vaccines mandatory.

2. Children are statistically at zero risk of dying from COVID. Their survival rate is in the range of 99.997-99.998% or, put another way, their risk of dying with COVID is less than 2 in every 1,000,000 children. The very few children who are listed as COVID deaths did not die OF COVID, but rather WITH COVID as anyone being admitted to a hospital nowadays is tested. I challenge the Washington State Board of Health to show medical records for even one child who has died OF COVID. Where there's no risk, there can be no benefit.

3. No one knows the long term risks of these vaccines. You may remember that one of the members of the FDA Advisory Committee famously said, "We are never going to learn about how safe this vaccine is until we start giving it" Dr. Eric Ruben, Editor in Chief NEJM The studies Pfizer conducted were woefully underpowered. This is an analysis of 10 Red Flags associated with Pfizer's studies: Ten red flags in the FDA's risk-benefit analysis of Pfizer's EUA application to inject American children 5 to 11 with its mRNA product – Commentary – America's Frontline Doctors (americasfrontlinedoctors.org <<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Famericasfrontlinedoctors.org%2F&da>)

Force vaccinating healthy children for a disease that doesn't affect them to make adults feel safe is a new low for humanity. Please do the right thing and do not require these vaccinations for school age children.

Thank you,

Renee Marceau

Subject: Comments on Jan BOH Meeting

External Email

Attn: Kaitlyn

I attended the zoom meeting on Jan 12, 2022, in its entirety, and was hoping for the opportunity to share my comments on Items # 8 and # 11. However, I doubt it would have made any difference.

Listening to all those that did verbally share, or made comments in the Q&A box, it was loud and clear that the voice of the people were in unison on their utter discontent of the Board of Health's direction on the matters.

It was also quite clear, based on how quickly the BOH voted to dismiss the Informed Choice Washington's Petition for Rulemaking, that your minds were made up on the matter before you even began that meeting.

It would seem that over 7500 Washington Citizens wasted their time supporting and/or commenting that day. But we ARE not going to be silent or denied our voice. And the number of those involved will double, then triple, and your meetings will need to be held more often and for longer periods so that we all get our 1 minute.

None the less, I just want it to go on record that I SUPPORT the adoption of ICWA's Petition for Rulemaking on agenda item 11, which asks the Board to establish a new rule that prohibits them from adding any Emergency Use Authorized (EUA) product, or any licensed product that lacks completed Phase 3 trial studies, to the school required list.

I also OPPOSE the Board's formation of a Technical Advisory Group (TAG) to review information about COVID-19 shots for consideration of mandating the shots for school. I oppose COVID-19 shot mandates, period!

I'm praying for you all and fighting this battle on my knees.

See you in March at the next meeting!

Sincerely,
Anne Burbank

Subject: WAC codes

External Email

To Whom it may concern,

We are writing this email as citizens of the state of Washington in opposition to using WAC 246-100-070, WAS 246-100-045, and WAC 246-100-040 to force an emergency order to involuntarily detain a person or group to be isolated in a quarantine facility following refusal to comply with above stated laws regarding Covid-19.

We are also in opposition to including the Covid-19 injections as part of the school immunization requirements using WAC 246-105. These vaccinations have not met the required testing time frame, and therefore long term effects are not known. It is also known that the percentage of children seriously affected by Covid-19 is very small.

Respectfully submitted,
Ken and Tracy White

Subject: Tomorrow's meeting

External Email

Dear Ms. Donahoe,

The present situation with omicron is no longer a health emergency. People are not dying from covid anymore, not in numbers that make for a public emergency. People have always died from influenzas and pneumonias, from car wrecks and drownings, and we don't abandon our God-given rights in an effort to stamp out all of these possible deaths. The extreme measures you contemplate in dealing with what has become a minor threat would further hurt adults and children instead of helping them. Whatever power structures exist in your Codes, you don't have a moral right to trample on peoples's '...life, liberty, and the pursuit of happiness.'

You have no moral authority to impose mandatory shots into people's bodies. People own their own bodies. You do not own other people's bodies. You may not do as you see fit with other people's bodies. The people who imprisoned Martin Luther King, Jr.—did they have the legal right to do that? The bus driver who asked Rosa Parks to go to the back of the bus—did he have the right to do that? The national guard and police who blasted civil rights protestors with water hoses and set dogs on them—did they have the right to do that? Yes, they had a "right" by the laws and policies of the day, but they were in the wrong. The hindsight of history shows to all that they were wrong. The truth will out; many people already know that it is wrong of you to contemplate involuntary detention of citizens. Future people will absolutely know it, just like we absolutely know who was right in the civil rights movement led by MLK.

We also know who was morally right when Japanese American citizens were involuntarily concentrated into camps. We know who was wrong. Monetary reparations and public apology was awarded decades later to Japanese American citizens—right here in WA—who were involuntarily detained into camps at that shameful time.

There will be only shame for those who act immorally to involuntarily detain and/or bully citizens and children into camps and near-forced requirement of experimental injections. We Americans know that our legal rights to "life, liberty, and the pursuit of happiness" are solid both in Constitutional law and in the moral law which is written in our hearts.

I urge you not to overstep whatever powers you have to do whatever you want in this little day. Tomorrow morning, please remember that both yourself and your fellow citizens alike are all 'created equal' and have 'unalienable rights.' We hold these truths to be self-evident, that involuntary detainment of citizens is wrong, and mandating experimental shots for children against the will of their parents is wrong. Please maintain the public trust by respecting our unalienable rights.

Sincerely,
Deirdre Forman
WA resident

Subject: RE: Urgent Notice to the Washington State Board of Health Regarding Mandating the Covid-19 mRNA Vaccines for All Students Across the State

RE: Urgent Notice to the Washington State Board of Health Regarding Mandating the Covid-19 mRNA Vaccines for All Students Across the State

i: a woman; Vija Rogozina; write a Notice of Liability to you; a woman, who at times serves as a Board Member and as a community representative.

Here are three reasons for NOT mandating genetic mRNA vaccine for all Seattle Public School students:

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.medrxiv.org%2Fcontent%2F10.1101%2F2021.11.30.21267048v1.full.pdf>
<https://www.medrxiv.org/content/10.1101/2021.11.30.21267048v1.full.pdf>

3. Please review Pfizer's 6-month data. I'm attaching the document along with the link under "breaking news" called "More Harm Than Good." Although this is from Canada, we share lots of information, because we are all using the same vaccines.
<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.canadiancovidcarealliance.org>

<https://www.canadiancovidcarealliance.org/>

I also urge you to go to the VAERS database and study statistics of adverse vaccine events and mortality. The numbers reached over one million cases in December 2021 and more than 21,000 Americans have died after becoming part of the largest human experiment in history.

The mistrust the public is experiencing is due to the extreme measures that have been taken against the people and coercive unethical measures that have not been supported by the actual data:

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fcdc.gov%2Fdata-tracker%2F%23trends_dailycases&data=04%7C01%7Ckaitlyn.donahoe%40sboh.wa.gov%7Cd160812d799

https://covid.cdc.gov/covid-data-tracker/#trends_dailycases

People are informed, aware, and very unhappy that medical procedures are being mandated and yet have not proven to stop the spread, stop transmission, nor stop hospitalization as was touted in the beginning of rolling out these vaccines. People are also aware of fraudulently hyperinflates numbers of unvaccinated cases due to a new definition of 'fully vaccinated' as per Jan 5th, 2022, which refers to 'Fully Vaccinated & Boosted' vs "Fully Vaccinated" & "Not Boosted, Partially Vaccinated", "Vaccine Free". Vaccine breakthrough cases increased by over 1.1 million confirmed breakthrough cases from November to December, which explains fraudulent statistics given to the American people.

With so many risks and little benefit, i, along with many others, intend to hold those responsible for bringing forth the mandate for Covid-19 vaccines to all students and any potential health damage. I ask you to consider the repercussions of force, mandates, and new laws that hurt the freedoms afforded us by God or the ones supported by the US Constitution. It is our privilege and duty to protect our children from any and all harm.

So, i urge you to vote from your innermost consciousness, with regards to data and with a Precautionary Principle in mind. Do not follow the directives and social pressure from the institutions that might be implicated in willful misconduct. Ask yourself: What Would Consciousness Do?

i, sincerely thank you for your community service. It is only because of the people on the ground, like you and i, that real change is ever possible. i, sincerely believe that this still holds true! Thank you once again for honoring the Hippocratic Oath, Nuremberg Code and Precautionary Principle by voting NO.

Sincerely,

by: Vija Rogozina

Good Day Michelle,

On January 6, 2022 I sent you a public comment, at this time I have not heard back from you regarding having read my comment.

I have all of the delivery receipts from sending the email on January 6, 2022.

Since I have not heard back from you or from the Washington State Board of Health, I am sending you a "Notice of Liability and Affirmation and Demand for Rebuttal or Remedy".

You have now been formally served.

Subject: My Public Comments...Regarding Proposed Final Agenda for January 12 Public Meeting...11. Rulemaking Petition – Chapter 246-105 WAC, Immunization Criteria, Child Care and School Entry –Possible Action

Written Notice of Liability for Washington State Board of Health

Notice to Agents is Notice to Principals; Notice to Principals is Notice to Agents

Good Day,

I would like to emphasize that I am your neighbor. I bear you no ill will and presume you are all decent, well-intentioned people.

Every policy that you have enacted or enabled under the guise of COVID-19 that denies people - living men, women, boy and girls - equal access to public accommodations unless they submit to long-term wearing of masks, invasive diagnostic testing, or injections of gene-modification therapies is unlawful.

First, people are divine creations and are only bound by divine law, not by man's law. The first sentence of the first law of this country, the Declaration of Independence, states this clearly: "Men [and women] are endowed by their Creator with unalienable rights." These are absolute and unconditional. What is given by our Creator cannot be taken away by you. The supreme court has upheld this countless times. Your coercive policies violate our unalienable rights under the pretense of law.

Second, all three of these policies involve medical procedures. In 1947 civilized society declared in Article 1 of the Nuremberg Code that this type of coercion is everywhere and always a crime against humanity.

Policies relating to COVID-19 and Pierce County Resolution No. R2021-224 are violations of the 1st, 4th, 5th, and 9th Articles of the Bill of Rights and are by definition Rape, Bodily Invasion, Abduction, Abuse, Molestation and Maltreatment at the very least.

This is a betrayal of your allegiance to the Constitution for the united States of America, and thus to us, it's beneficiaries. Your polices, therefore, are a breach of fiduciary duty and treason.

You have not been granted permission to pass such mandates as proposed.

I do not grant you permission to proceed with passing such mandates.

If you do not comply with this cease and desist direction, I will hold each and every one of you accountable for these deprivations of rights, crimes against humanity, and treason.

Please understand that I have every remedy available to me.

Your individual liability is unlimited.

You have now been offered lawful Notice of due process.

Dear Michelle Davis, All Washington State Board of Health Members and Executives,

On January 6, 2022, I sent you an email as a written Verbal Notice of Liability for Washington State Board of Health. (see attached)

Under Federal Rules of Evidence 902 once I record this Notice it is self-authenticating. Your failure to rebut is admission to the truth of the Affirmations and judgment on the Remedy contained therein without your or your agent's objection due to estoppel by acquiescence.

Every policy that you have enacted or enabled under the guise of COVID-19 that denies people - living men, women, boy and girls - equal access to public accommodations unless they submit to long-term wearing of masks, invasive diagnostic testing, or injections of gene-modification therapies is unlawful.

First, people are divine creations and are only bound by divine law, not by man's law. The first sentence of the first law of this country, the Declaration of Independence, states this clearly: "Men [and women] are endowed by their Creator with unalienable rights." These are absolute and unconditional. What is given by our Creator cannot be taken away by you. The supreme court has upheld this countless times. Your coercive policies violate our unalienable rights under the pretense of law.

Second, all three of these policies involve medical procedures. In 1947 civilized society declared in Article 1 of the Nuremberg Code that this type of coercion is everywhere and always a crime against humanity.

Policies relating to COVID-19 are violations of the 1st, 4th, 5th, and 9th Articles of the Bill of Rights and are by definition Rape, Bodily Invasion, Abduction, Abuse, Molestation and Maltreatment at the very least.

This is a betrayal of your allegiance to the Constitution for the united States of America, and thus to us, it's beneficiaries. Your polices, therefore, are a breach of fiduciary duty and treason.

You have not been granted permission to pass such mandates as proposed.

I do not grant you permission to proceed with passing such mandates.

If you do not comply with the direction, you have just been given, I will hold each and every one of you accountable for these deprivations of rights, crimes against humanity, and treason.

Please understand that I have every remedy available to me.

Your individual liability is unlimited.

You have now been offered lawful Notice of due process.

You have a further ten (10) business days from the date of this Notice to cure your breach of Notice of Liability and to do so by January 25, 2022.

If you do not, I will immediately provide you and all the members of the Washington State Board of Health with the following, without limitation:

1. Complaints against your faithful performance bonds
2. Criminal referrals under Title 18 US code 241-242
3. Civil action for deprivation of rights
4. Demand for a common law grand jury dependent upon the results of the foregoing.

I reserve all rights and remedies available to me in any jurisdiction or venue.

By alissa karin ray-keough

Subject: UNMASK THE CHILDREN

External Email

Hello,

Please unmask the children now.

How many more studies do we need to show that masks have no or very little efficacy in preventing spread?

How many more children must harm themselves before the mask wearing is finished?

How many more children must kill themselves before the mask wearing is finished?

What are we doing? You can judge a nation by how it treats their children, this is just sick. Covid has officially become a cult.

We can't move on with our lives because of the Board of Heath and Governor Inslee's draconian policy.

How many vaccinated people and previously infected people combined will it take to remove the mandates?

Why is natural immunity not recognized?

Why isn't the data transparent and shown with reasonable justification to support the policies?

The public health and treatment policies have done more to harm people than Covid has, multiple studies support this claim.

More states continue to drop mandates, why not Washington?

Everyone and I mean everyone knows we are being lied to with data and power hungry corrupt politicians and policy.

You have officially lost any and all educated and reasonably minded individuals with these continued policies.

These policies are killing business, trust, culture, and our children's psychological states.

My children and the rest of the children in this state are suffering, because of the policy. Covid not so much, it was a cold.

Why is the "worst virus" in history also the most politicized?

Are we hell bent on protecting people or destroying society?

Every policy, mandate. And action has done nothing to slow the spread. Has the motive become clear?

END IT NOW, ENOUGH IS ENOUGH.

Open the state, open the schools, take off the masks, and give people their lives back. Those who remain scared can stay at home and wear 5 masks at a time and get a booster every 6 months.

For the sake of your state and country, call for resignations or END IT ALL?

Sincerely,

A parent of children you are hurting.

External Email

Dear Board Members,

I did not see a place to comment about the idea of mandating the COVID vaccine for kids. I would like to voice my opinion against that, as I would not send my kids to school if that becomes a requirement. With similar viral loads in both unvaccinated and vaccinated populations, this does not make sense from a public health standpoint. Furthermore, this vaccine is experimental and we have no idea what the long term consequences will be as these children become adults. The decision to put this vaccine into a child should be between parents and doctors, not the state.

Thank you for hearing my concerns,

I am writing you to ask why mandates are not being lifted? There is no reason for it not to unless you are like Justin Trudeau and are trying to cause segregation and division. The governor did call the unvaccinated terrorists, so maybe that is the plan. I live in the same place as the governor, I probably shop in the same grocery store. All I have seen happening is more and more judgment. More and more either you are on our side or you are less than the dirt on my shoes. The rest of America is getting back to life, building bridge and trying to bring communities together. Sadly I see none of that here. Sadly I see neighbor suspicious of neighbor. We were the first to go in lockdown, will we be the last to come out of it? I have lived in WA for 31 years and now I think I will have to find a new state to call home. Please lift mandates, please end segregation. Thank you Clarice

Subject: No vaccine requirements for kids

External Email

Good morning BOH team -

I share a reminder of something we all know deep down.

God has placed the governance of the family with the family. Parents are His hierarchical representatives for children (Deuteronomy 6).

There is an eternal state of judgement and rewards and we will be held accountable for every deed (2 Corinthians 5:10). Usurped authority and supporting the deception of a propped up narrative will not receive a free pass now or eternally.

You each know individually there is no need to have COVID-19 vaccines for children. You know it is a benign disease that is inconsequential for children. You know that any suggestion otherwise is an egregious sacrifice of children for selfish gain. You know the narrative supporting this has fallen apart and is abandoned in most of our country and in many countries across the world.

Even if you are the only one, stand up for kids because Jesus is King not Caesar (Matthew 28:18, Revelation 1:5).

In truth and love,

J Huffman

Hello. I just wanted to add my vote in support of having vaccinations for school students (and teachers). This definitely includes COVID shots, as long as we are in a pandemic situation. When we reach the stage where COVID is acting like a flu, then we should consider removing it from "required".

I will also add my opinion on the masks. I know they are unpopular with many... but as a 28 year educator... having everyone wear masks this year cut out on so many more "bad bugs" than COVID. My annual Strep Throat did not happen, two years in a row! Wiping desks down and masking has helped keep attendance up. You will never keep it up, but I'm just wishful thinking that we could.

Thanks.

Good morning,

Thank you for all that you do for our community. May I please ask for your help?

I really wish there was something that we could do to support the children in our community pertaining their right to breathe fresh air. It is so unnecessary that they wear masks at school for this virus that is 99% survival rate in children's age group.

We need to see their smiling faces.

They need to see their friend's smiling faces.

They need to see their teacher's smiling faces.

They need it as part of feeling connection to our community. We need to help their mental health and growing brains receive the air they are entitled to breathe. This is just absurd this has gone on this long. This isn't fair.

Please help end this.

Also,

Please DO NOT enforce Gene Therapy AKA covid inoculation requirements for children in our state. This would be discrimination against me and my family. I know of many other families as well that this would discriminate against as well.

We live in the United States of America. We are entitled to our freedom of making our own personal medical choices. For ourselves and for our children. Personal medical autonomy has decades of established law decided at the Supreme Court. Please watch the attached video for more information about the VAERS coming from Pfizer. Which is very alarming.

<https://resistthemainstream.org/heres-the-pfizer-video-that-got-dr-robert-malone-suspended-off-twitter>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fresistthemainstream.org%2Fheres-the-pfizer-video-that-got-dr-robert-malone-suspended-off-twitter&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1096822e9d15404c321808d9e26d9dc1%7C11d0e>>
/

Please remember that VAERS is a statutory requirement of the fda. How is covid-19 a true state of emergency still when the survival rate is so high?

I have chosen to not be inoculated and contracted covid right after Christmas. And I am ok! My entire family is ok! Everything is ok! Everyone should be allowed to make the personal choice of medical treatment, period. we have natural immunity! Let's focus on natural immunity and healthy hygiene.

Please do not make Gene Therapy AKA, EUA (which has a 99% survival rate) ' Covid Vaccine', a requirement for public schools. Promoting myocarditis (which is a common

side effect of the inoculation) in our youth is completely unethical. The risk simply outweighs any benefit, because what is the benefit? They would still catch and spread virus, so there are absolutely NO benefits.

There is already discrimination happening if my child has a common cold and I call to her school office to let them know she will be absent. They ask right away if she is vaccinated. I ask, "with what?" They say, "covid vaccine." This is no one's business if my child is injected with gene therapy. But once they get an answer from me, they put our situation in a "side A" or "side B" flow sheet. (Brings times back to NO BLACKS ALLOWED AT THIS WATER FOUNTAIN for example) Just like they do with the volunteers at the school district. This is creating MASSIVE SEGREGATION.

The current situation for having a cold and staying home to get well school process is performing unconstitutional discrimination against my family. Religious beliefs and personal medical choices are personal choices. Please set an example in our state to show that we honor our people of America and allow them the freedom that our constitution states we all have!

Lets spread kindness and love and promote healthy hand washing, not discrimination and segregation.

Please help end this.

Thank you for your time.

May God Bless you and your loved ones,

Subject: Local control for lifting mask mandates

External Email

Dear State Board of Health Members and others to whom it may concern,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

Subject: Commit to no COVID vaccine mandates on children

External Email

Dear Washington State Board of Health,

Our state government should NOT be mandating Covid vaccines on our children. Children are at extremely low risk for Covid and these medical decisions should be left in the hands of parents.

Sincerely,

The Citizens of Washington State

CURRENT NEWS ANALYSIS by CLIFF HIGH

The founder and current leader of the WEF, Klaus Schwab, has been recorded on video claiming at least a 50% 'penetration' of 109 Western republic cabinets, or governments, and at least 5 US States to the gubernatorial level, WA State prominent among those. Jay R Inslee is featured on the WEF membership pages indicating complete ownership, and control of him, and of the government of WA State, by Klaus Schwab's WEF agenda. It was through this coordination of these 109 captured governments, and at least 5 US States, as well as, the Federal government of the US, and the majority of UN working groups, that the Covid global tyranny plan has been pursued.

1.

On 2022.01.29, the Global Revolution began in Canada. It will spread.

2.

The 'pandemic' is over. The People have decided to end it. In support of this process, the People have organized and are sharing the 'receipts' that prove the complicity, and guilt of those under the control of the WEF, and its affiliated organizations. Politicians here in the USA, as well as other Western Republics, will soon be attempting to scrub their on-line records of associations to the WEF, no matter how tenuous. It will not aid them.

3.

A major casualty of War, and especially in War practiced as Revolution, is Secrecy. This Revolution is already yielding documentation that will be used in the trials pending as this Movement proceeds. Persons guilty of committing Crimes against the populace via malfeasance in Public Health institutions, as well as the Laws controlling them, may expect to be prosecuted.

4.

People injected with the 'vaccines' are dying at 3 to 4 times the usual, and historical, normal rates. This will grow with time for these next 3 years. Rates of cancers, and other debilitating conditions are many thousands of percent higher in 'vaccinated' individuals. These facts are becoming understood by the Populace. As this knowledge spreads, as well as the effects of the injections throughout the Populace, it will be expected that the damaged victims will seek recompense from the Guilty.

5.

A wise person, upon recognizing that they had been close enough to the Guilty personalities to have been tainted by association, would prepare now for the inevitable questioning, investigation, and judgment of their role in the proceedings of this pandemic

operation.
6.

The events of this decade are being powered by the demographic and economic Long Waves of History as the Petrodollar collapses the global central banking consortium. As a Legislator, in charge of the Public Purse, this banking system collapse will greatly affect your work and future. The wise person will expect events to become far more chaotic and unsettled as we progress further into this decade.

Dear Sir or Madame,

On February 28th, 2021, Pfizer and the FDA had data from a study on all-cause mortality after the "vaccine" injections, but this data was never released to the public. This data should have stopped the "vaccination" program immediately.

One America Insurance, a company based in Indiana, has actuarial data showing a 40% increase in death rate for young people age 18 and up, after the injections began in 2021.

Reliable data from the Department of Defense on military-age young people has shown that after the injection program began in 2021, there has been a 300% increase (3 times higher) in miscarriages, a 300% increase in cancer, a 1000% increase (10 times higher) in neurological diagnoses that especially affect pilots.

News reports from doctors, nurses, attorneys, and financial experts have discussed this data, and criminal charges have just now begun to be filed against those responsible at the federal level, but this will eventually make its way down to the state level. The level of criminality is such that an economic collapse of Pfizer and other pharmaceutical companies is expected, worse than happened to Enron twenty years ago.

The FDA has a legal definition for a vaccine, but the Covid shot does not comply with this definition because it is from new technology. The term "vaccine" is used to make it more acceptable to the public. The phrase "safe and effective" is a complete lie.

Recently in 2021, embalmers who work in funeral homes, who have had decades of experience, are seeing unusual blood clots that they have never seen before, in patients who have been injected. They have saved hundreds of samples for further study. These clots are as long as a patient's leg and have a white cord as part of the clot structure.

Pharmaceutical companies have some limited liability for patient injuries as a result of the 1986 act passed in Congress and signed by Pres. Reagan, but they have ZERO liability for experimental drugs, such as the Covid injection. Comirnaty was licensed in August 2021, but IT IS NOT AVAILABLE. Only the unlicensed experimental injections WITH NO LIABILITY FOR THE PHARMACEUTICAL COMPANIES are available.

The fraud perpetrated under the endless "emergency powers" in our state is out of control, and must NOT continue with the children and infants. The children, especially, receive NO benefit from the vaccine but incur unacceptable risks for injury.

Regards,

Deanna Burlingame
Eatonville, Wa.

I am a grandparent of grade school kids. Our kids should not be pond's for this political Government Mandate. Our grandkids parents are both Nurse's and know that vaccines are not preventing anyone from getting or giving the Covid. PLUS, kids don't usually even get ANY SYMPTOMS!! NO, I am NOT in favor of this mandate. IT IS THE PARENTS RIGHT TO CHOOSE...

Good afternoon.

In this email, I will argue that there is also no evidence whatsoever to support a vaccine mandate for 5- to 11-year-old kids, and such a mandate is both unscientific and immoral.

Specifically, I will show that:

1. Covid was already a very mild illness for healthy children, and the Omicron variant looks to be even milder.
2. Kids 5 to 11 years old have never been significant spreaders of SARS-CoV-2 (to other children or adults).
3. Covid infection in kids produces far more robust and long-lasting immunity than the vaccines.
4. More than half of kids in the U.S. (and likely other industrialized countries) have already had Covid-19, and vaccinating kids with natural immunity doesn't provide additional protection.
5. There is no direct evidence that vaccines reduce severe illness, hospitalization, or death in 5- to 11-year-old kids. This is even more true with Omicron.
6. The Covid vaccines do not prevent transmission of the virus (especially with the Omicron variant).
7. There is already concerning evidence of harm from the vaccines in 5- to 11-year-old kids—and the long-term effects are unknown.
8. The mandates will cause serious and lasting harm to unvaccinated children.

#1: Covid was already a very mild illness for healthy children, and Omicron looks to be even milder

We've known since the beginning of the pandemic that the vast majority of Covid-19 cases in healthy children 5 to 11 years old are extremely mild.

According to the Centers for Disease Control and Prevention (CDC)

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2F covid.cdc.gov%2F covid-data-tracker%2F%3FCDC_AA_refVal%3Dhttps%253A%252F%252Fwww.cdc.gov%252F coronavirus%252F2019-ncov%252Fcases-updates%252Fcases-in-us.html%26utm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs_email-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcd3lChLvHXaBrJX%23demographics&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83

us.html%26utm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs_email-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcd3lChLvHXaBrJX%23demographics&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83

, there have been just 216 deaths in this age group since the start of the pandemic. This represents only 0.03% of the total Covid-19 deaths, despite the fact that 5- to 11-year-old kids comprise almost 9% of the population.

With 28,384,878 kids in this age group, that's a mortality rate of 0.0008%. Put another way, at worst, a child 5 to 11 years old has a 1 in 131,411 chance of dying from Covid-19.

But even this very low number is likely to be a significant overestimate for healthy children for two reasons.

The first is that Covid deaths have almost certainly been over-counted in the U.S. and other industrialized countries because of how they are classified. For example, say a child with a pre-existing leukemia diagnosis is admitted to the hospital for issues related to their disease. The child tests positive for SARS-CoV-2 upon admission, does not develop any signs or symptoms of Covid-19 infection, but later dies due to complications of leukemia. This will be classified as a Covid-19 death—even though, in this case, Covid-19 likely had nothing to do with the child's passing.

The second reason is that the majority of hospitalizations and deaths in 5- to 11-year-olds occur in children with pre-existing health conditions. A study by the CDC back in September 2020

<[https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.cdc.gov%2Fmmwr%2Fvolume-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-](https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.cdc.gov%2Fmmwr%2Fvolume-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9)

NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9 found that, among 121 childhood deaths related to Covid-19, 75% had an underlying health condition. Another study by the CDC

<[https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.cdc.gov%2Fcoronavirus%2Fncov%2Fdata%2Fpdf%2F2020.pdf%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs_email-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-](https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.cdc.gov%2Fcoronavirus%2Fncov%2Fdata%2Fpdf%2F2020.pdf%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs_email-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9)

NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9 found that 53% of kids hospitalized for Covid-19 had at least one pre-existing condition,

the most common being obesity (45%), asthma (14%), and neurological conditions (13%). Yet another large, international review of 14 studies

<[https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.pharmacytimes.com%2Fview-with-pre-existing-conditions-experience-more-severe-covid-19%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs_email%2-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-](https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.pharmacytimes.com%2Fview-with-pre-existing-conditions-experience-more-severe-covid-19%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs_email%2-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9)

NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9 covering almost 20,000 children found that kids with pre-existing conditions were over

25 times more likely to experience severe symptoms from Covid-19 infection than healthy kids.

The point here is not that kids with pre-existing conditions don't deserve our consideration. Of course they do! The question I am trying to answer in this email is whether the vaccines should be mandated for all 5- to 11-year-old children, including healthy ones. And to do that properly, we have to know what the risk is for healthy children specifically.

Unfortunately, the CDC does not routinely distinguish between healthy kids and kids with pre-existing conditions in their reporting of Covid-19 hospitalizations and deaths. But some other industrialized countries do.

For example, a recent study out of Germany

<[https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.medrxiv.org%2Fcontent%2Fujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-](https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.medrxiv.org%2Fcontent%2Fujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9)

NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9 looked at just over 400,000 healthy 5- to 11-year-old kids with no pre-existing conditions who tested positive for Covid-19. They found:

- * A rate of hospitalization of 8.5 per 100,000 (~1 in 11,750)
- * A rate of ICU admission of 2 per 100,000 (1 in 50,000)
- * A rate of death of ZERO (there was not a single death in this age group)

This gives us a much better idea of what we can expect in terms of the risk of

hospitalization and death in healthy kids in this age group.

And all of the early data we have so far suggest that Omicron is far milder than all previous variants.

For now, it's enough to say that if the current trends hold, we should expect the risk of hospitalization and death from Covid-19 in healthy children—which is already incredibly low—to be lower still in the future.

When we consider that:

- * Covid-19 was already an extremely mild illness for healthy kids 5 to 11 years old
- * Hospitalizations and deaths have been over-counted
- * Omicron appears to be far milder than previous variants

... we get a current risk of serious outcomes like ICU admission or death in healthy 5- to 11-year-old kids that is minuscule.

#2 Kids have never been significant spreaders of SARS-CoV-2 (to other children or adults)

Some advocates of vaccine mandates have argued that, while Covid-19 is a mild illness in kids, we should vaccinate them anyway in order to protect those at the highest risk, like the elderly and individuals with pre-existing conditions.

In order for this argument to be valid, two things would need to be true:

1. We'd need evidence of significant child-to-adult and child-to-child transmission of Covid-19.
2. We'd need evidence that the vaccines prevent, or at least significantly reduce, the transmission of SARS-CoV-2.

In fact, neither of those is the case.

Studies have now shown that kids under 10 years old rarely transmit Covid-19

<[https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.sciencedaily.com%2Frelease-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-](https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.sciencedaily.com%2Frelease-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcd3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9)

NIKEQgpAcd3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9>, and all kids/adolescents up to 20 years old are only 43% as susceptible to the disease and 63% as likely to infect others

<[https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.courthousenews.com%2Fkids-dont-spread-covid-like-a-plague-models-indicate%2F%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_medium%3De-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-](https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.courthousenews.com%2Fkids-dont-spread-covid-like-a-plague-models-indicate%2F%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_medium%3De-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcd3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9)

NIKEQgpAcd3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9> than adults.

NIKEQgpAcd3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9>

Given that neither of these things is true, the argument that we should vaccinate kids to protect the vulnerable has no scientific basis.

#3: Covid infection in kids produces far more robust and long-lasting immunity than the vaccines

Another argument I've heard to justify a massive vaccination campaign for 5- to 11-year-old kids is that the vaccines provide more robust immunity than a natural infection and that because of this, the vaccines will "end the pandemic."

Numerous studies have now shown that this is not the case, and, in fact, the opposite is true: kids who have a Covid-19 infection go on to develop much stronger, more lasting, and broader immunity against future SARS-CoV-2.

A new, peer-reviewed study published in Nature Immunology on December 22

<[https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.nature.com%2Farticles%2F2021-01089-](https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.nature.com%2Farticles%2F2021-01089-8%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs_email%26-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcd3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9)

8%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs_email%26-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-

NIKEQgpAcd3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9 found that both the innate (initial antibody response) and adaptive (later T-cell response) immune reaction to SARS-CoV-2 is much stronger in children than in adults.

In other words, kids who get Covid-19 mount a more effective and robust immune response to the disease than adults do. What's more, this immune response lasted throughout the entire length of the study period—which was nearly one year—and it appeared to protect them against multiple SARS-CoV-2 variants.

The authors speculate that increased immunity to coronaviruses that cause the common cold, and are cross-reactive with SARS-CoV-2, may be part of the reason that children are more protected from Covid-19 than adults.

From the study:

"□□□ Conclusion, we showed that children display a characteristically robust and sustained adaptive immune response against SARS-CoV-2 with substantial cross-reactivity against other hCoVs [human coronaviruses]."

Given how remarkably low the risk of serious illness is in 5- to 11-year-old kids, and given how strong and long-lasting their immune response is to natural infection, wouldn't it make more sense to simply allow healthy kids in this age group to get Covid-19—especially now that the Omicron variant is becoming dominant—rather than expose them to vaccines with uncertain benefits and concerning side effects (more on both of these points below)?

#4: More than half of kids in the U.S. (and likely other industrialized countries) have already had Covid-19

At the end of May of this year, the CDC estimated

<[https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.cdc.gov%2Fcoronavirus%2Fncov%2Fcases-](https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.cdc.gov%2Fcoronavirus%2Fncov%2Fcases-updates%2Fburden.html%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_s-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcd3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9)

updates%2Fburden.html%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_s-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-

NIKEQgpAcd3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9 that 36% of all children had been infected with SARS-CoV-2. That estimate was made 16 months into the pandemic. If we adjust that estimate for the current time frame (22 months), we get 49.8% or roughly half of U.S. children.

However, the CDC estimate was performed before the emergence of the Delta and Omicron variants, both of which are significantly more transmissible than prior variants. Therefore, it is highly likely that the rate at which kids were getting infected between May 2021 and now is significantly higher than during the first 16 months of the pandemic. This means that more than half of U.S. children have natural immunity against Covid-19.

The Nature Immunology paper I just mentioned above clearly indicates that natural immunity to Covid-19 is especially robust in children.

And so far, there is little convincing evidence that vaccinating someone who has already been infected offers any benefit.

For example, a study published in June 2021 by Cleveland Clinic

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.medrxiv.org%2Fcontent%2Ffigure/Figures/2020/07/28/2020.07.28.20169441v1.pdf&contextmenu=open&track=click>
-ujih6hHRi6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-

NIKEQgpAc d3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sb oh.wa.gov%7C1c208bb83 of almost 53,000 people found that vaccinating people with natural immunity (i.e., those who had already been infected with SARS-CoV-2) did not confer additional protection. Most importantly, there was not a single case of reinfection among the 1,359 previously infected, unvaccinated subjects in the study.

The fact that most kids have already had Covid-19 and thus already have immunity to it, and that vaccinating people who've already been infected doesn't strengthen their protection against the virus, casts even further doubt on a universal vaccine campaign for 5- to 11-year-olds.

#5: There is no direct evidence that vaccines reduce severe illness, hospitalization, or death in 5- to 11-year-old kids

Severe illness in kids is so rare that there wasn't a SINGLE case of severe Covid-19 or a SINGLE death from Covid-19 in the 2,268 kids that Pfizer studied to obtain their Emergency Use Authorization (EUA)

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.fda.gov%2Femergency-preparedness-and-response%2Fcoronavirus-disease-2019-covid-19%2Fcomirnaty-and-pfizer-biontech-covid-19-vaccine%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs_email-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9...>
by the CDC.

Because there were no significant adverse outcomes from Covid-19 in the trial, Pfizer had to estimate the potential benefit by looking at the antibody response generated by the vaccine in the kids' blood.

There are several problems with this. First, antibodies are a poor predictor of clinical response to Covid-19

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.npr.org%2Fsections%2Fhealth%2F2021%2F08%2F28%2F1031287076%2Fantibody-tests-should-not-be-your-go-to-for-checking-covid-immunity%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs_email%26utm_medium%3Demail%26utm_content%3DUSPS%26mc_cid%3Dd9e0c0f0e0%26mc_eid%3D1031287076%26usqp%3Dmq%3Dyes&cid=USPS%26mc_cid%3Dd9e0c0f0e0%26mc_eid%3D1031287076%26usqp%3Dmq%3Dyes

NIKEQgpAc3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb8
. Second, since there were no cases of severe Covid-19 in kids in this study, Pfizer had
no idea what antibody level would be protective against severe infection.

This means that any claims you've seen that the Pfizer vaccine is 90% effective are misleading because this only refers to an antibody response in the blood from the vaccine and not actual protection against severe illness, hospitalization, or death.

Yes, the massive campaign to vaccinate 5- to 11-year-old kids is based on a small study of 2,268 kids in which the vaccines did not prevent a single case of severe Covid-19 or a single death and demonstrated only an elevated antibody response in those that received the vaccine.

#6: The Covid vaccines do not prevent transmission of the virus (especially with the Omicron variant)

Even before the emergence of the Omicron variant, we already knew that the Covid vaccines do not significantly reduce transmission of the virus. Unlike the measles or polio vaccines, they do not provide “sterilizing immunity”—that is, they don’t keep people from getting the virus or spreading it to others.

CDC Director Rochelle Walensky disclosed this back in August 2021 in an interview with Wolf Blitzer on CNN

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.realclearpolitics.com%2Fvideo%2Fstory%2F687968%2F&cid=msn-com-intl-uk-topstories-news-story%2F687968>
-ujih6hHRi6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-
NIKEQgpAcD3lChLvHXaBrJX%23!&data=04%7C01%7Cwsboh%40sbob.wa.gov%7C1c208bb83f1c4232e5ad
. She said:

"They [the vaccines] continue to work well with 'Delta' with regard to severe illness and death, but what they can't do anymore is prevent transmission." [Emphasis added]

But in countries where Omicron has become the dominant variant, we have even less reason to believe that the vaccines do anything at all to reduce transmission.

Data out of Ontario, Canada has been issuing detailed reports on cases. You can see in the chart below that, as of late December, the number of Omicron cases per 100,000 people is virtually identical in the unvaccinated, partially vaccinated, and fully vaccinated:

Also, a preprint study out of Denmark

https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.medrxiv.org%2Fcontent%2Fujih6hHRi6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIIEQgpAcD3lChLVHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9 shows that vaccine effectiveness against Omicron drops to nearly zero just over two months after peak protection (14 days after the second dose). Even more disturbingly, the vaccines go into negative effectiveness—meaning those who were vaccinated were more likely to contract Covid-19—3 months after peak protection.

Here's the key figure from that study. The blue dots represent vaccine effectiveness against Delta, and the green dots/bars represent vaccine effectiveness against Omicron. When the dot is above the horizontal line, effectiveness is positive. When it's below the line, it's negative.

Finally, we have data from the U.K.'s "SARS-CoV-2 variants of concern and

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fassets.publishing.service.gov.uk%2Fgovernment/uploads/system/uploads/attachment_data/file/97861/briefing-33.pdf%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs_email%26utm_medium%3Demail%26utm_content%3DUjH6hHRi6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9

variants under investigation in England, Technical briefing 33

"indicating that even with a booster, symptomatic protection against Omicron wanes significantly after just 10 weeks:

“Among those who received an AstraZeneca primary course, vaccine effectiveness was around 60% 2 to 4 weeks after either a Pfizer or Moderna booster, then dropped to 35% with a Pfizer booster and 45% with a Moderna booster by 10 weeks after the booster. Among those who received a Pfizer primary course, vaccine effectiveness was around

70% after a Pfizer booster, dropping to 45% after 10-plus weeks and stayed around 70 to 75% after a Moderna booster up to 9 weeks after booster.”

Frankly, these are remarkable data that raise questions about the effectiveness of the current vaccines against Omicron for people of all ages, not just 5- to 11-year-old kids.

It’s clear that we are not in the same situation today that we were in when the vaccines were initially developed. Omicron is very different from Alpha, which was the dominant strain when the vaccines were released. And as these studies clearly show, these vaccines aren’t as effective against Omicron as they were against earlier variants.

At best:

- * Two shots of Pfizer provide just over 50% effectiveness for about a month; that drops close to zero just after the second month and goes deeply negative before the third month.

- * Two shots of Moderna provide just under 50% effectiveness for about two months; that drops to zero in the third month, and into negative territory shortly after that

- * A booster provides an additional 2.5 months of partial protection (below 45% for all but people who received two shots of Pfizer plus a Moderna booster).

If we were starting out with the current vaccines today, with Omicron, that’s the level of protection they would provide. We’d have to start giving boosters just 2–3 months after the initial shots and then give a booster every 2–3 months after that. Does that make sense, given how mild Omicron is for healthy kids (and most adults)?

It’s worth noting that most of these data regarding Omicron infections and vaccination status are from adults, not children, because the vaccines have only recently been offered to 5- to 11-year-old kids. But there is no reason to believe that vaccines will be more effective against Omicron in children than they are in adults (and, in fact, there are reasons to believe they would be less effective, as I’ve described earlier in this email).

#7: ☐☐ This is already concerning evidence of harm from the vaccines in 5- to 11-year-old kids—and the long-term effects are unknown

Despite the incredibly low risk that Covid-19 poses to healthy children, the fact that over 50% of kids have already had Covid, and that natural immunity is robust and durable, some still might argue that vaccinating children makes sense.

After all, if we can save even one life with the vaccines, shouldn’t we do that?

Certainly, if we knew without a doubt that 1) vaccinating every 5- to 11-year-old child would prevent even a small number of severe illnesses and deaths, and 2) the vaccines were 100% safe and would not cause any adverse events, then this would be a strong argument.

However, we still don’t know that vaccinating children this age actually reduces severe illnesses or deaths. All we know is that the vaccines induce an antibody response.

And we already know that the vaccines are not 100% safe and are producing a significant number of adverse events in children 5 to 11 years old. This should not be surprising. All medical interventions have potential side effects and risks, and the Covid vaccines are no exception.

The CDC’s own data show harm for the vaccines—despite Director Walensky’s denial

According to the CDC's data, as of December 9, 2021, there have been 3,233 reports of adverse events in kids 5 to 11 years old from the Covid-19 vaccines, including 14 reports of myocarditis (8 of which have already met the CDC criteria for a vaccine-induced myocarditis case).

It's worth pointing out that myocarditis is only one of several possible side effects that have been observed with the Covid-19 vaccines

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.medrxiv.org%2Fcontent%2Fujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9, which include arthritis, autoimmunity, acute liver and kidney injury, thyroiditis, and more.

It's also important to know that the Vaccine Adverse Event Reporting System (VAERS) is imperfect, and adverse effects are often underreported. For example, a 2001 study

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Facademic.oup.com%2Faje%2Farticle-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9 found that less than half of cases of rotavirus vaccine-associated intussusception (severe intestinal disorder) were successfully reported to VAERS. And a 2020 study <https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fmedium.com%2Fmicrobial-instincts%2Funderreporting-and-post-vaccine-deaths-in-vaccine-adverse-event-reporting-system-vaers-explained-14fe22b2a65f%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3D found that the reporting sensitivity for anaphylaxis (severe allergic reaction) and Guillain-Barré syndrome (severe nerve disorder)—both of which have been seen with the Covid-19 vaccines—ranged from 12%–76%.

There are at least 2 reasons to believe that underreporting of side effects for the Covid-19 vaccines is at least as prevalent as the studies above suggest—and probably more:

- * Many doctors and nurses are afraid to report side effects of the vaccines because of the current polarized political climate.
- * The vaccine program for 5- to 11-year-olds began only recently, and there's often a lag time between receiving the vaccines, side effects, and reporting of those side effects.

Nevertheless, let's be generous and assume that the underreporting of side effects from the Covid-19 vaccines in VAERS is only 0.5, or one-half. This would mean 6,466 adverse events reported from 7,141,428 doses of the vaccine in 5- to 11-year-olds, or a risk of a vaccine-related adverse event of 1 in 1,104.

This compares with (according to the German study I mentioned above) a risk of hospitalization of 1 in 11,750, a risk of ICU admission of 1 in 50,000, and a risk of death of zero from Covid-19 in a sample of 400,000 kids.

To make it as clear as possible: these data suggest that, for healthy kids 5 to 11 years old, there is a much higher risk of an adverse event from the vaccine than there is of preventing a hospitalization, ICU admission, or death from Covid-19.

You might argue, "Well, if those adverse events from the vaccine are mild, what does it matter?" That's a reasonable question to ask. However, many of the side effects reported to VAERS are in the moderate-to-severe range. Most people won't bother with the time or hassle required to file a VAERS report if they simply had a sore arm for a couple of

days.

OpenVAERS

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fopenvaers.com%2Fcovid-data%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs_email%-ujih6hHRi6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-

NIKEQgpAc3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9 has been diligently reporting on the raw VAERS data throughout the pandemic. According to their website, there have been 983,756 Covid vaccine-related reports submitted to VAERS as of December 17, 2021 across all ages. Within the 5- to 11-year-old age group, these include:

- * 2 deaths
- * 90 hospitalizations
- * 331 urgent care visits
- * 772 doctor's visits
- * 2 cases of Bell's Palsy
- * 3 cases of anaphylaxis

These are clearly not mild side effects, and together with the CDC's data on myocarditis risks, there is enough evidence to warrant concern about both the short- and long-term effects of these vaccines—especially since they are being given to healthy children with their entire lives ahead of them.

In addition to the known risks above, there are also the unknown risks. While mRNA vaccines have been studied for many years, they are new, experimental therapies in humans with no long-term safety data. We simply don't know the long-term risks of these vaccines.

#8: The mandates will cause serious and lasting harm to unvaccinated children

So far, we've focused on the risks and benefits for 5- to 11-year-olds receiving the Covid vaccines.

But if these vaccines are mandated as a condition of attending schools in person, as some districts in the U.S. and abroad have already done, we also must consider the potential harm that children who remain unvaccinated—for any reason—may experience as a result of not being able to go to school.

An unvaccinated child will be punished by withholding in-person education and contact with their peers and teachers. This is a far higher risk than a healthy child faces from contracting Covid-19.

School closures have already caused untold harm to children—some of which may be lifelong. As Dr. Vinay Prasad of UCSF has argued, “school closure was the greatest self-inflicted wound of the pandemic

>https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fbrownstone.org%2Farticles%2Fh
could-they-have-done-this-to-the-
children%2F%3Futm_campaign%3DChris%2520Kresser%2520General%2520News%26utm_source%3Dhs
-ujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-

,"

As evidence for this, we've seen a disturbing rise in mental and behavioral health issues like anxiety, depression, and obsessive compulsive disorder in children. A study published in March 2021

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.ncbi.nlm.nih.gov%2Fpmc%2Fpubmed/36879221&cid=7d95f554-2310-46fd-a6db-7c9eebbcd1e2&contextmenu=link&format=raw>
-ujih6hHRi6z1Ngk4jTJH7craQ-eRu4H_83KeRgEJ_xogK-

NIKEQgpAc d3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C1c208bb83f1c4232e5ad08d9 documented a wide range of harms experienced by children during lockdown (which would be similarly experienced by kids excluded from in-person education because of their vaccination status):

- * An increase in stress and neuroinflammation
- * Rising rates of anxiety, depression, and psychosis
- * Weight gain and poor diet
- * Potential long-term effects caused by removal from normal social development context
- * Rising social inequalities
- * Multiple impacts from lack of play

The list goes on and on. But even studies like this one, which can take months to research and publish, are not documenting the full effects. Public health departments, school counselors, and mental health professionals around the world are reporting deeply disturbing patterns.

This is a terrifying and horrific statistic that should be sounding the alarms on the impact of keeping kids away from school and isolating them from their peers and other important people in their lives.

We've also seen disturbing examples of unvaccinated children being shamed and forced to justify their status in front of the class—a disgusting and scientifically baseless (as you now know) tactic designed to force them into compliance.

Is this the world that we want to live in, where parents are forced to decide between giving their children an unnecessary, ineffective, untested, and unsafe vaccine with both known and unknown adverse effects, so the kids can continue to participate in a normal, healthy life, or not give their kids the vaccine and remove them from many if not most of their typical activities, including attending school in person, eating out at a restaurant, or playing on a sports team?

We do not have to take this path.

Other countries have chosen not to. For example, the U.K.'s expert body the Joint Committee on Vaccination and Immunisation (JCVI) has decided not to vaccinate healthy 5- to 11-year-old children

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.theguardian.com%2Fsociety-set-to-recommend-vaccinating-vulnerable-five--to-11-year-olds%3FCMP%3DShare_AndroidApp_Other%26utm_campaign%3DChris%2520Kresser%2520General%2520-%2Fujih6hHRI6z1Ngk4jTJH7craQ-eRu4H_83KeRqEJ_xoqK-NIKEQgpAcD3lChLvHXaBrJX&data=04%7C01%7Cwsboh%40sbob.wa.gov%7C1c208bb83f1c4232e5ad08d9
(though they did approve vaccination for kids in this age group with underlying health conditions).

Even if we decided to make the vaccines available for healthy kids in this age group—which I don't think is an evidence-based decision, for the reasons I've laid out above—there's absolutely no basis for making them mandatory.

- * They do not prevent transmission, especially with Omicron.
- * There is no direct evidence that they reduce the risk of hospitalization or death.
- * The risk of serious illness in healthy kids is extremely low (and likely even lower with Omicron).
- * Over half of kids have already had Covid-19 and have robust and lasting immunity. There is no evidence that vaccinating kids with natural immunity provides additional protection.

* There is already evidence of harm from the vaccines.

As parents and caregivers, we have a moral and ethical obligation to safeguard the health and well-being of our children. Mandating the Covid vaccines for 5- to 11-year-olds not only fails to achieve this goal, but it works directly against it in numerous ways.

Thank you for supporting the lives of our children and voting NO on mandating Covid-19 vaccine for them.

Sincerely,
Peggy Martinez

I oppose the proposed WAC's 246-100-070, WAC 246-100-045, WAC 246-100-040, WAC 246-100, WAC 246-105

I am completely against giving local health officers use of law enforcement and the use of an emergency order to involuntarily detain a person or family into a quarantine facility if they refuse the requests of medical examination, testing, treatment, counseling, or vaccination.

I am completely against covid-19 injections as part of the school immunization requirements using WAC 246-105.

Dear Washington State Board of Health,

Our state government should NOT be mandating Covid vaccines on our children. Children are at extremely low risk for Covid and these medical decisions should be left in the hands of parents.

Sincerely,

The Citizens of Washington State

State Board of Health members,

Please refer to the attached document that has been submitted to your BOH at least twice, and now another time from myself.

Do Not subject our children to this unknown, untested, experimental gene-therapy injection that has proven to be quite injurious to thousands. Our children are at extremely low risk for Covid, and it is up to the Parents, not some BOH to decide whether or not their children are to be experimented upon.

I am requesting that this pdf document and my remarks be made official comment to your TAG meeting tomorrow.

Concerned citizen & advocate for all Medical Freedoms,

Sue Coffman

*Informed*CHOICEWA.org

Date: January 7, 2021

To: The Washington State Board of Health Members and COVID-19 TAG

From: The Board and Members of Informed Choice WA

Dear Board of Health and TAG Members:

You are facing what may prove to be the most important decision you will ever face as a member of the board or a group, or perhaps in your life.

The mRNA and DNA COVID-19 shots are unlike any other vaccines given before. The global push for their uptake and the volume of reported adverse reactions and deaths following administration are unprecedented. The hundreds of thousands of medical and scientific professionals globally standing up and speaking out against the response to COVID and to the shots is unprecedented, as is censorship on scientific debate. When this nation's top doctors and scientists are being kicked off of social media platforms and being fired from their jobs for daring to speak on their findings and science critical of current policies, it is clear something has gone terribly wrong.

The CDC acknowledges the shots do not prevent infection or transmission and that any protection afforded fades rapidly, yet they refuse to abandon their push for increased uptake and boosters, and they refuse to promote existing early treatment protocols or acknowledge the mountain of evidence of the superior safety and effectiveness of naturally-acquired immunity. The systemic capture of federal agencies by the drug industry and globalists has never been more obvious.

Public Health in the U.S. is currently suffering from a lack of checks and balances and a dangerous dilution of critical facts. If every citizen were to watch the FDA's Vaccine and Related Biologicals Advisory Committee (VRBAC) meetings and to read the entirety of the clinical trial submissions to the FDA and the injury and death reports filed with Pfizer and VAERS, they would understand the experimental nature of the COVID shots and the known and suspected risks. They would question the clinical trial irregularities, the buried data, the lack of independent evaluation, and the high levels of conflicts of

interest. But most do not. Votes for recommendation are made by federal entities despite the lack of scientific justification and the details of the meetings are not incorporated into the language passed down to citizens. The messaging becomes, “The vaccines are safe and effective and recommended by the CDC.” This simplistic false messaging creates division at all levels of society, undermines fully informed consent, violating federal regulations and human rights declarations.

If after the past two years of witnessing the erratic federal response to COVID you still have faith in federal recommendations, we ask you to consider one clear example that reveals the federal agencies and committees do not deserve your trust. In the absence of a single co-administration safety study, the ACIP approved and the CDC actively promotes this message:

“COVID-19 vaccine and other vaccines may be administered on the same day.”

This is not science. This is not safety. This is not in the best interest of vaccine recipients. This is using Americans, especially our children who are most impacted, as unwitting test subjects. This is human experimentation without informed consent. This is criminal.

We are asking you today to honor the Precautionary Principle and First Do No Harm. We are asking you to dismantle the TAG, to halt rulemaking consideration for adding COVID shots to school requirements, and to adopt our Rulemaking Petition for a new rule that would prohibit mandating Emergency Use Authorized products and licensed products that lack completed Phase 3 trials.

Attached is our preliminary response to the “Criteria for Reviewing Antigens for Potential Inclusion in WAC 246-105-030” that supports our requests. There is far more scientific and medical information available. We hope this is just the beginning of your reviewing the critically important information you have likely been missing until now.

Sincerely,

The ICWA Board

Bernadette Pajer, Yael Kantor, Heidi Hartnell, Angela Dye

**Informed Choice Washington Presents:
A review of the COVID-19 shots
(Pfizer, Moderna, Janssen)
using the Washington State Board of Health's
"Criteria for Reviewing Antigens for Potential Inclusion in
WAC 246-105-030"**

<https://sboh.wa.gov/Portals/7/Doc/Publications/ImmunizationCriteria-Update2017-Final.pdf>

Before proceeding, it must be noted that the COVID-19 shots currently available do not meet the definition of "immunizing agent" per WAC 246.105.020(13), which states:

"Immunizing agent" means any vaccine or other immunologic drug licensed and approved by the United States Food and Drug Administration (FDA), or meeting World Health Organization (WHO) requirements, for immunization of persons against vaccine-preventable diseases.

None of the currently available COVID-19 shots are licensed and approved by the FDA for school-age children; the shots similarly do not meet WHO requirements and are only authorized by the WHO for emergency use.

WAC: <https://app.leg.wa.gov/WAC/default.aspx?cite=246-105-020>

For clarity, BOH's criteria language is shown in red, and ICWA language is shown in black.

I. Criteria on the effectiveness of the vaccine

1. A vaccine containing this antigen is recommended by the Advisory Committee on Immunization Practices and included on its Recommended Childhood & Adolescent Immunization Schedule.

The vaccine **must** be recommended by the ACIP. The ACIP reviews **licensed** vaccines. It makes recommendations for newly licensed vaccines and regularly updates its recommendations. Its process includes:

- (1) a review of the Food and Drug Administration (FDA) labeling/package inserts for each vaccine;
- (2) a thorough review of the scientific literature (both published and unpublished, when available) on the safety, efficacy, acceptability, and effectiveness of the immunizing agent, with consideration of the relevance, quality, and quantity of published and unpublished data;
- (3) an assessment of cost effectiveness;
- (4) a review of the morbidity and mortality associated with the disease in the population in general and in specific risk groups;
- (5) a review of the recommendations of other groups; and
- (6) a consideration of the feasibility of vaccine use in existing child and adult immunization programs. Feasibility issues include (but are not limited to) acceptability to the community, parents, and patients; vaccine distribution and storage; access to vaccine and vaccine administration; impact on the various health care delivery systems; population distribution effects; and social, legal, and ethical concerns. [emphasis added]

Do any of the COVID-19 shots fulfill this criterion? No.

The ACIP did NOT recommend a COVID-19 shot licensed by the FDA for use in ages 5-11 or 12-15, nor did it place such a shot on the CDC Recommended Schedule.

There is no FDA COVID-19 shot licensed for ages 5-15 and no COVID-19 shot whatsoever on any CDC Recommended Schedule for any age. CDC Immunization Schedules, <https://www.cdc.gov/vaccines/schedules/index.html>.

The CDC recommended schedule website page for ages 7-18 mentions the ACIP's EUA and BLA recommendations for COVID, but it DOES NOT include the shots on the schedule.

On May 12, 2021, the ACIP adopted the following recommendation: "The Pfizer-BioNTech COVID-19 vaccine is recommended for children 12-15 years of age in the U.S. population under the FDA's Emergency Use Authorization." *May 12, 2021 ACIP Meeting - Discussion and Vote*, CDC YouTube channel, <https://youtu.be/91FCQN1aYqk>.

On November 2, 2021, the ACIP adopted a similar recommendation for 5-11 year olds. *Nov 2, 2021 ACIP Meeting - Clinical considerations for COVID-19 vaccination & Votes*, CDC YouTube channel, <https://youtu.be/Fknv90AxSn8>.

Federal Emergency Use Authorization statutes indirectly prohibit school mandates of EUA products by requiring recipients be informed they have the option to accept or refuse the vaccine:

"The possible side effects of the vaccine are still being studied in clinical trials. . . Under the EUA, there is an option to accept or refuse receiving the vaccine."
Vaccine Information Fact Sheet for Recipients and Caregivers about the Pfizer-BioNTech COVID-19 Vaccine to Prevent Coronavirus Disease 2019

(COVID-19) for Use in Individuals 5 through 11 Years of Age, pp. 4-5,
<https://www.fda.gov/media/153717/download>.

The option to accept or refuse an EUA product is not conditioned upon written assertion of exemption. Medical, personal, or religious exemptions are not required in order to exercise the right to refuse. Under EUA law, a parent or guardian may simply decline a shot for their minor child, without providing explanation or paperwork. A state-level daycare or school requirement would introduce the need for filing of exemptions, unlawfully exceeding the parameters set forth by Congress for EUA products.

“FDA believes that the terms and conditions of an EUA issued under section 564 preempt state or local law, both legislative requirements and common-law duties, that impose different or additional requirements on the medical product for which the EUA was issued in the context of the emergency declared under section 564.” *Vaccine EUA Questions and Answers for Stakeholders*, U.S. Food & Drug Administration,
<https://www.fda.gov/emergency-preparedness-and-response/mcm-legal-regulatory-and-policy-framework/vaccine-eua-questions-and-answers-stakeholders#61b6059d67093>

Alarming, the CDC and ACIP made this recommendation even though they acknowledged that for both age groups:

Regarding potential harms after vaccination, evidence was type 4 (very low certainty) for serious adverse events and type 1 (high certainty) for reactogenicity. No data were available to assess the other GRADE benefits and harms including prevention of hospitalization due to COVID-19, prevention of multisystem inflammatory syndrome in children (MIS-C), SARS-CoV-2 seroconversion to a non-spike protein, or prevention of asymptomatic SARS-CoV-2 infection.

The Advisory Committee on Immunization Practices’ Interim Recommendation for Use of Pfizer-BioNTech COVID-19 Vaccine in Adolescents Aged 12–15 Years — United States, May 2021, CDC MMWR, May 21, 2021,
<https://www.cdc.gov/mmwr/volumes/70/wr/mm7020e1.htm> and *The Advisory Committee on Immunization Practices’ Interim Recommendation for Use of Pfizer-BioNTech COVID-19 Vaccine in Children Aged 5–11 Years — United States, November 2021*, CDC MMWR November 12, 2021,
<https://www.cdc.gov/mmwr/volumes/70/wr/mm7045e1.htm>.

Vaccines and Related Biological Products Advisory Committee (VRBPAC) member Dr. Eric Rubin stated “[Just b]ecause we give an EUA to the vaccine, doesn’t mean we have to use it. And I think we would have to think hard about how to use it given all of the concerns that have been raised.” Transcript of *FOOD AND DRUG ADMINISTRATION (FDA) Center for Biologics Evaluation and Research (CBER) 166th Vaccines and Related Biological Products Advisory Committee (VRBPAC) Meeting*, June 10, 2021, p. 242. <https://www.fda.gov/media/150815/download>.

How can the CDC claim that benefits outweigh risks when they admit they do not know the risks?

Comirnaty is the only COVID-19 product that has ostensibly received FDA licensure for any pediatric populations—namely those 16 and up; however, that licensure is limited to manufacturing and delivery. The FDA has stated that this product is merely “**ready** for approval for **use** in individuals 16 years of age and older . . .” [emphasis added]. *August 23, 2021 Approval Letter - Comirnaty*, from FDA to BioNTech, p. 4, <https://www.fda.gov/media/151710/download>. The Comirnaty vaccine is not available anywhere in the United States, and there is debate about whether the vials of Pfizer’s EUA product are now “licensed” for those 16 and up, or if those are still EUA products. The FDA states that EUA Pfizer-BioNTech COVID-19 Vaccine and the Comirnaty (COVID-19 Vaccine, mRNA) “are legally distinct with certain differences that do not impact safety or effectiveness.” There is much debate over what “legally distinct” means, especially to consumers. If “legally distinct” means that the currently available Pfizer products in the U.S. are under EUA regulations, then there is no licensed product available for 16-18 year olds. Regardless of whether the Pfizer product is licensed for 16-18 year olds, the product lacks completed Phase 3 clinical trials, and the PREP Act still shields manufacturers for liability for injuries and deaths. As far as we can tell, never in history has the FDA licensed a product without completed clinical trials, nor when all the ongoing trials have been unblinded, subverting the ability to compare outcomes.

There are ZERO co-administration safety studies; therefore, it is highly concerning that the CDC states, and the Washington State Department of Health repeats: “COVID-19 vaccine and other vaccines may be administered on the same day.” CDC, Immunization Schedule, COVID-19 Vaccination, <https://www.cdc.gov/vaccines/schedules/hcp/imz/child-adolescent.html>

Disregarding the absence of any safety studies, the Washington DOH states, “Your child can get a COVID-19 vaccine at the same time they get other vaccines. You do not need to schedule your child’s required school vaccinations or other recommended vaccines separately from COVID-19 vaccination. A COVID-19 vaccine appointment is another opportunity to get your child caught up on all of their recommended vaccines.”

Washington State Department of Health, Vaccinating Youth,
<https://www.doh.wa.gov/Emergencies/COVID19/VaccineInformation/VaccinatingYouth#VaccineTiming>

As noted in our cover letter, this is not science. This is not safety. This is not in the best interest of vaccine recipients. This is using Americans, especially our children who are most impacted, as unwitting test subjects. This is human experimentation without informed consent. This is criminal.

2. The vaccine containing this antigen is effective as measured by immunogenicity* and population-based prevention data in Washington State, as available.

*Immunogenicity means the ability of an antigen or vaccine to stimulate the body to produce an immune response. Vaccines often include antigens that stimulate an immune response to a particular disease but are not necessarily the same as the organism that would cause the disease.

In the clinical development of a vaccine, the effectiveness of the vaccine is studied using FDA-approved research protocols that evaluate whether a vaccine protects individuals from contracting the disease in population-based studies or generates an immunologic response (immunogenicity) comparable to vaccines that have been shown to be effective in preventing disease. More information about its population-based effectiveness is gained from large trials and community-based analyses after FDA approval. There may or may not be effectiveness data from Washington State, but the disease prevalence and incidence in the state should be sought and reviewed.

Do any of the COVID-19 shots fulfill this criterion? No.

Immunogenicity: While the COVID-19 shots trigger the recipient's cells to create spike proteins, which then trigger an immune response and antibodies to the self-created spike proteins, this immune response has proven incapable of preventing infection or transmission. In short, the COVID shots do not prevent recipients from "contracting the disease."

Some studies show recipients may be afforded a short window—a few weeks or months—during which their risk of infection or risk of severe disease is minimally reduced in comparison to those without natural immunity, but even this protection appears to be dropping with each new variant.

This preprint study shows that PCR-positive tests for Delta variant occurred in a higher percentage of vaccinated individuals than in unvaccinated. From this it could be concluded that, regardless of vaccination status, all individuals are able to spread COVID-19 with similar viral loads. Riemersma et al., *Shedding of Infectious SARS-CoV-2 Despite Vaccination*,

<https://www.infosperber.ch/wp-content/uploads/2021/10/210731-Wisconsin.Viral-Load.pdf>.

Dr. Rochelle Walensky states that the vaccine does not prevent infection or transmission of the Delta variant, CNN interview with Wolf Blitzer, July 27, 2021, <https://www.youtube.com/watch?v=TKFWGvvlVLI>

Another pre-print study, Acharya et al., *No Significant Difference in Viral Load Between Vaccinated and Unvaccinated, Asymptomatic and Symptomatic Groups Infected with SARS-CoV-2 Delta Variant*, “found no significant difference in cycle threshold values between vaccinated and unvaccinated, asymptomatic and symptomatic groups infected with SARS-CoV-2 Delta.” <https://www.medrxiv.org/content/10.1101/2021.09.28.21264262v1>.

The CDC reported that among the first U.S. cases of COVID-19 attributed to the Omicron variant, 79% of the 43 cases studied occurred in fully vaccinated individuals, including 14 who had received booster doses. *SARS-CoV-2 B.1.1.529 (Omicron) Variant — United States, December 1–8, 2021*, CDC MMWR, December 17, 2021, <https://www.cdc.gov/mmwr/volumes/70/wr/mm7050e1.htm>.

The criterion explicitly requires that “information about population-based effectiveness is gained from large trials,” yet the clinical trial study on which the EUA was based for 5-11 year olds included only 2,268 children total. CDC and ACIP acknowledged that the study was too small to find serious adverse reactions. (See our response above to Criterion #1.) *Evaluation of the BNT162b2 Covid-19 Vaccine in Children 5 to 11 Years of Age*, N Engl J Med 2022; 386:35-46, DOI: 10.1056/NEJMoa2116298, <https://www.nejm.org/doi/full/10.1056/NEJMoa2116298>.

A pre-print study suggests that vaccine effectiveness wanes to negative effectiveness, therefore increasing chances of contracting COVID, after 90 days. The authors suggest a booster would be necessary in order to attain previous levels of protection. Do parents really want their child to get a booster every 90 days? Would this be practical or manageable? Hansen et al., *Vaccine effectiveness against SARS-CoV-2 infection with the Omicron or Delta variants following a two-dose or booster BNT162b2 or mRNA-1273 vaccination series: A Danish cohort study*, <https://www.medrxiv.org/content/10.1101/2021.12.20.21267966v3#p-5>

In contrast to the inability of the COVID shots to prevent disease, natural immunity has been found to prevent infection. This superior, broad protection will serve children well throughout their lives. “[C]hildren display a characteristically robust and sustained adaptive immune response against SARS-CoV-2 with substantial cross-reactivity against other hCoVs.” Dowel, et al., *Children develop robust and sustained*

cross-reactive spike-specific immune responses to SARS-CoV-2 infection,
<https://www.nature.com/articles/s41590-021-01089-8>

In study after study, it has been shown that natural immunity far exceeds vaccine-induced immunity in length and quality. Please view the following studies here that show the superiority of natural immunity: "144 Research Studies Affirm Naturally Acquired Immunity to Covid-19: Documented, Linked and Quoted," Brownstone Institute, October 17, 2021.

<https://brownstone.org/articles/79-research-studies-affirm-naturally-acquired-immunity-to-covid-19-documented-linked-and-quoted/>

3. The vaccine containing this antigen is cost effective from a societal perspective.

This analysis should consider both the costs of the immunization (e.g. antigen, storage, administration, medical and societal costs of adverse reactions to the immunization, etc.) and the benefits of the immunization (e.g. lives saved, medical and societal benefits of preventing adverse reactions from vaccine-preventable disease, etc.). This process may include consultation with an economist as resources allow. Vaccines may be cost effective without being cost saving. In other words, the direct costs of some vaccines (e.g. antigen, storage, administration) balanced against direct savings (e.g. medical care, disability, death) may not result in net savings. Societal or indirect costs (e.g. lost productivity of care takers of ill children) will also need to be taken into consideration. These costs are much harder to quantify. Not all vaccines recommended by the ACIP are cost saving or equally effective, so some determination of the vaccine's relative cost effectiveness may need to be made for comparison purposes when applying the criteria.

Do any of the COVID-19 shots fulfill this criterion? No.

To parents and members of Informed Choice Washington, the most important consideration in this criterion is the "medical and societal costs of adverse reactions to the immunization" as well as what the criterion overlooks:

- the cost of ignoring or outright censoring lifesaving preventative and early treatment protocols, which lead to superior natural immunity;
- the cost of exposing children to genetic therapies, such as DNA and mRNA injections, in the absence of adequately sized and designed safety studies for either short or long-term outcomes;
- and the cost of interrupting a child's natural immune response to what is now an endemic virus without a complete understanding of how that interruption will impact their immunity to the virus and its mutations in the future.

Please see risk information provided under Criterion #4 below, in particular, the two graphs summarizing data from Pfizer's clinical trials that have already demonstrated that any benefits from the shots are outweighed by the injuries and death they cause. This does not account for long-term and yet unknown harms.

4. Experience to date with the vaccine containing this antigen demonstrates that it is safe and has an acceptable level of side effects

Vaccinations are not without side effects. The known risks associated with each vaccine (or antigen) must be balanced against the risks of the disease. Vaccine safety will be evaluated using research and reports from: pre-licensure, the Vaccine Adverse Event Reporting System (VAERS) and the Vaccine Safety Datalink (VSD) project, and other reliable sources.

Do any of the COVID-19 shots fulfill this criterion? No.

While Pfizer's own randomized control trial data indicated a decrease in positive cases, they also showed an increase in illnesses and deaths compared to the placebo group. There is no benefit to reducing cases if it comes at the cost of increased illness, hospitalizations, and death.

The graphic below includes Table S3, *Participants Reporting at Least 1 Adverse Event From Dose 1 to 1 Month After Dose 2 During the Blinded Follow-up Period*, on page 11 of [Pfizer's six-month supplementary appendix](#) to its study entitled [Safety and Efficacy of the BNT162b2 mRNA Covid-19 Vaccine through 6 Months](#). Vaccinees experienced worse health outcomes than did placebo recipients.

The following graphic, which includes Table S4, *Causes of Death from Dose 1 to Unblinding*, on page 12 of [Pfizer's six-month supplementary appendix](#) to its study entitled [Safety and Efficacy of the BNT162b2 mRNA Covid-19 Vaccine through 6 Months](#), illustrates the increase in deaths within six months for those who received the injections. Of particular concern are the types of death, including cardiovascular events

Pfizer's inoculations for COVID-19 / MORE HARM THAN GOOD

INCREASED RISK OF DEATH

Screen capture from Pfizer 6 Month Supplementary Appendix

Reported Cause of Death*	BNT162b2 (N=15,224)	Placebo (N=15,221)
Death	15	14
Acute respiratory failure	0	1

Table S4 | Causes of Death from Day 1 to Unblinding Study Population, 246 Years OMB, n.
Multiple causes of death could be reported for each participant. There were no deaths among 13-15-year-old participants.

Notes: and efficacy of the BNT162b2 mRNA COVID-19 vaccine through 6 months. Supplementary Appendix

	BNT162b2	Placebo
Deaths before unblinding (in Table S4 of Supplementary Appendix)	15	14
Deaths after unblinding (Prior to table, but maintained in text of 6-month report. See quote below.)	5	
Total Deaths	20	14

"After unblinding" means when the Placebo participants were given the opportunity to "cross over" and take the BNT162b2 inoculation.*

"... 3 participants in the BNT162b2 group and 2 in the original placebo group who received BNT162b2 after unblinding died."

Safety and Efficacy of the BNT162b2 mRNA COVID-19 Vaccine through 6 Months

	BNT162b2	Placebo
Total COVID-19 Related Deaths	1	2
Deaths Related to Cardiovascular Events	9	5

*A total of 15,122 subjects originally randomized to placebo crossed over to receive BNT162b2 after unblinding. Days 1 and 2 were 45 and 46, respectively, before the March 15, 2021 data report.

12

One 12-year-old child, Maddie de Garay, participated in Pfizer's study. She suffered multiple and severe injuries, requiring 9 ED visits and 3 hospital stays (totaling 64 days by June 1, 2021). She is still in a wheelchair today. The New England Journal of Medicine article in which Pfizer's RCT results was reported, [Safety and Efficacy of the](#)

[BNT162b2 mRNA Covid-19 Vaccine through 6 Months](#), failed to disclose any of Maddie's adverse reactions. Pfizer disingenuously mischaracterized her injuries as "functional abdominal pain" in its *Emergency Use Authorization (EUA) Amendment for an Unapproved Product Review Memorandum*, p. 30.

<https://www.fda.gov/media/148542/download>. Senator Ron Johnson held a roundtable, in which many individuals who took the COVID-19 vaccine shared their adverse reaction experiences that required medical attention.

<https://thehighwire.com/videos/stephanie-and-maddie-de-garay-testimony/> at 5:13.

This study asks a very pertinent question: Why are we vaccinating children against COVID-19? The abstract in this study explains the following:

A novel best-case scenario cost-benefit analysis showed very conservatively that there are five times the number of deaths attributable to each inoculation vs. those attributable to COVID-19 in the most vulnerable 65+ demographic. The risk of death from COVID-19 decreases drastically as age decreases, and the longer-term effects of the inoculations on lower age groups will increase their risk-benefit ratio, perhaps substantially... (emphasis added.)

This study goes on to say that:

... it will use the term 'inoculated' rather than vaccinated, because the injected material in the present COVID-19 inoculations prevents neither viral infection nor transmission (emphasis added.)

Kostoff, Ronald, et al., "Why Are We Vaccinating Children Against Covid-19?" Toxicology Reports, Vol 8 2021, pages 1665-1684,
<https://www.sciencedirect.com/science/article/pii/S221475002100161X>

Here is a list of websites where medical professionals and/or individuals have documented their experiences with reactions from the COVID-19 vaccine:

<https://openvaers.com/covid-data/adverse-events-by-state>

<https://vaers.hhs.gov/data.html>

<https://www.c19vaxreactions.com>,

<https://www.RealNotRare.com/>

<https://www.medalert.org>

<https://www.scivisionpub.com/pdfs/us-covid19-vaccines-proven-to-cause-more-harm-than-good-based-on-pivotal-clinical-trial-data-analyzed-using-the-proper-scientific--1811.pdf>

Dr. Cody Meissner, VRBPAC member, stated: “I want to be sure that the risk of the vaccine is less than the risk of hospitalization because four [COVID hospitalizations per million in children under 18] certainly does not constitute an emergency, and there are significant questions about the safety of this vaccine. . . . [This hospitalization rate is] on the CDC website. That is not an emergency. It is a very low hospitalization rate. And the rates may change as the season changes, but we’re starting from a tiny, tiny rate. . . . [T]he rates are also falling pretty dramatically among adults and children. So as more people are immunized and become immune from infection, I think it’s very likely that we’re going to get this pandemic under pretty good control. Now the issue -- so the issue to me is safety. . . . [W]e can look at the 2,000 or 2,200 adolescents who are enrolled in the Pfizer vaccine between 12 through 15 years of age -- 2,200, so half got the vaccine, half got placebo. Nobody was hospitalized. Nobody died. And there were some who got URIs[upper respiratory infections] So 2,200 is not going to address the issue of safety. I’m worried about myocarditis. . . . [W]e don’t know what that means on a longterm basis. Will there be scarring of the myocardium? Will there be a predisposition to arrhythmias later on? Will there be an early onset of heart failure? I think that’s unlikely, but we don’t know that. And so before we start vaccinating millions of adolescents and children, it is so important to find out what the consequences are because COVID-19 disease is disappearing in adolescents and children. And I think we have to be so clear about what we’re dealing with. Let me make one more point. In 2003, there was a publication in JAMA regarding myocarditis following the Dryvax vaccine, the smallpox vaccine which is, of course, a live vaccine. But in that situation, the military -- it was given to young recruits. The rates of myocarditis in the military young men -- because it was mostly men in those days -- was 2 per 100,000. And after the Dryvax vaccine the rates were 7.8 cases of myocarditis in the 30 days afterwards. So there was a three-fold increase. And in fact, Dr. Tony Fauci wrote an editorial in that same issue of JAMA discussing these rates of myocarditis. So I am really concerned that the FDA may by not insisting on a full BLA, which to me means at least 12 months, maybe even 18 or 24 months of follow up in children and adolescents, before they are recommended to receive this vaccine. I do not feel we can justify a EUA including children under an Emergency Use Authorization. The burden of disease is so small, and the risks are just not clear. We don’t know.” June 10, 2021, VRBPAC meeting transcript, p. 62, p. 225- 228. <https://www.fda.gov/media/150815/download>

From the front lines in medical care

Many medical professionals are speaking up and sharing their experiences of working in hospitals right now as they care for patients who are coming in with what they can associate to vaccine reactions. “More VC Nurses Blow Whistle on ‘Overwhelming’ Numbers of Heart Attacks, Clotting, Strokes,” *The Conejo Guardian*, December 14, 2021. <https://conejoguardian.org/2021/12/14/more-vc-nurses-blow-whistle-on-overwhelming-numbers-of-heart-attacks-clotting-strokes/>

Individuals are sharing their own experiences with their health while taking the COVID shots. U.S. Senator Ron Johnson hosted a round table on November 2, 2021, to allow these individuals to tell their stories.

<https://childrenshealthdefense.org/defender/nov-2-sen-ron-johnson-cdh-covid-vaccine-injuries-federal-mandates/>

Colette Martin, an RN of 17 years, testified in front of the Louisiana House about the harms of vaccine reactions that she has witnessed. She also stated that more children have died from the vaccine than from covid itself. Louisiana House of Representatives Health and Welfare Committee Hearing, December 6, 2021,

https://www.house.louisiana.gov/H_Video/VideoArchivePlayer?v=house/2021/dec/1206_21_HW (begin at 6:54:00)

In the first two and a half months after EUA was granted, 1,223 deaths were reported to Pfizer. This is a huge red flag that requires deep investigation. See Table 1, Page 7, showing fatal case outcomes in Pfizer’s “5.3.6 Cumulative Analysis of Post-Authorization Adverse Event Reports of PF-07302048 (BNT162B2) Received Through 28-Feb-2021”

<https://phmpt.org/wp-content/uploads/2021/11/5.3.6-postmarketing-experience.pdf>,

While critics commonly question the veracity of VAERS data, as reported on the U.S. government’s Healthy People 2020 site, 83% of the reporters to the Vaccine Adverse Events Reports System were health care workers or pharmaceutical and government-based sources during the years 1990-2010. “The majority of VAERS reports are submitted by vaccine manufacturers (37%) and health care providers (36%). The remaining reports are obtained from state immunization programs (10%), vaccine recipients (or their parents/guardians, 7%) [sic], and other sources (10%).” Office of Disease Prevention and Health Promotion, Vaccine Adverse Reporting System, <https://www.healthypeople.gov/2020/data-source/vaccine-adverse-event-reporting-system>.

Further, 72% of a sampling of 250 of the 1,644 VAERS reports of early death received in the first three months of 2021 were filed either by health service employees or pharmaceutical employees. “We identified health service employees as the reporter in at least 67% of the reports, while pharmaceutical employees were identified as the reporter in a further 5%.” Even though the sample contained only people vaccinated early in the rollout, *i.e.*, those who were elderly or with significant health conditions, an adverse vaccine reaction could be ruled out in only 14% of the cases. Mclachlan, et al., *Analysis of COVID-19 vaccine death reports from the Vaccine Adverse Events Reporting System (VAERS) Database Interim: Results and Analysis*. 10.13140/RG.2.2.26987.26402. (2021)

“While it seems that the incidence of pericarditis during the vaccination campaign period is increased, a more comprehensive data collection on a wider scale should be done. We hope this report will raise awareness to the subject and will serve as a reminder to report events as part of the post-marketing investigations and allow for a thorough adverse events following immunization analysis.” *Transient Cardiac Injury in Adolescents Receiving the BNT162b2 mRNA COVID-19 Vaccine*, https://journals.lww.com/pidj/Fulltext/2021/10000/Transient_Cardiac_Injury_in_Adolescents_Receiving.1.aspx

II. Disease Burden Criteria

5. The vaccine containing this antigen prevents disease(s) that has significant morbidity and/or mortality in at least some sub-set of the population.

Vaccines have the potential to reduce, or in some cases even eliminate, diseases that can result in serious illness, long-term disability, or death. For example, before measles vaccine was available, nearly everyone in the United States contracted measles and an average of 450 measles-associated deaths were reported each year between 1953 and 1963. The morbidity/mortality burden of measles was not equal for all members of the population. Examples of significant morbidity measures include rates of hospitalizations, long-term disability, disease incidence, and disproportionate impact.

Do any of the COVID-19 shots fulfill this criterion? No.

First, we must emphatically state that it is unethical to use children as shields for adults.

Peter Doshi, Ph.D: “I want to address this idea of vaccinating children to protect adults. I encourage the Advisory Committee to read Dr. Lavine et al.’s editorial to explain why, “Vaccinating children is likely to be of marginal benefit in reducing the risk to others.” And even if you think a small benefit is better than nothing, let’s not forget that it’s an unproven hypothetical benefit. We need confirmatory evidence, not just assumptions. And then there’s the ethics and the law. **FDA can only indicate a product for use in a**

given population if benefits outweigh risks in that same population. So if benefits don't outweigh risks in children themselves, it can't be indicated for children, full stop. Whether vaccinating children might help adults is a moot point." Comments before the Vaccines and Related Biological Products Advisory Committee, June 10, 2021 <https://www.fda.gov/media/150815/download>, pp. 171-172. (emphasis added)

Children and young adults are at an extremely low risk of mortality from COVID-19. When one subset of the population (children) carries a high risk for injury from an antigen but low risk for injury from the disease, we must consider the mandate of such an antigen to be unethical. Bhopal, "Children & Young People Remain at a Low Risk of Covid-19 Mortality," *The Lancet Children & Adolescent Health*, Correspondence, Vol 5, Issue 5, E12-E13, May 1, 2021.

[https://www.thelancet.com/journals/lanchi/article/PIIS2352-4642\(21\)00066-3/fulltext](https://www.thelancet.com/journals/lanchi/article/PIIS2352-4642(21)00066-3/fulltext)

The *Forbes* article "The Hideous Truths of Testing Vaccines on Humans" examined the testing of hepatitis vaccines on the residents of Willowbrook, a home for severely disabled children. The author states: "In 1966, renowned medical ethicist Henry K. Beecher published an article titled, "Ethics and Clinical Research," which listed Willowbrook as an example of an unethical clinical experiment and concluded that "there is no right to risk an injury to one person for the benefit of others." *Forbes*, June 12, 2020,

<https://www.forbes.com/sites/leahrosenbaum/2020/06/12/willowbrook-scandal-hepatitis-experiments-hideous-truths-of-testing-vaccines-on-humans/>

Second, the measles example given in this criterion reveals that historically the BOH and DOH have never stepped back to consider the long term or unintended consequences of mass-vaccination campaigns. We agree that nearly everyone in the United States used to be exposed to measles, mostly in childhood when it's safest to experience, and they developed lifetime immunity. Merck's on-trial-for-fraud MMR vaccine does not confer lifetime immunity for a significant portion of the population, pushing susceptibility into the very young and into adult populations. We are nearing a time when more people in the U.S. will be susceptible to measles than before the vaccines were released. And studies show a third dose doesn't help. Was there perhaps a better way to reduce those 450 annual deaths and the cases of very severe illness, without sacrificing superior natural immunity for the vast majority (99.99%) of the population—and without exposing millions of children annually to the risks of the MMR? What about the failure of the mumps portion of the shot? More information can be found here: <https://informedchoicewa.org/measles/> To learn about the politics surrounding the loss of the personal exemption to the MMR, see this post:

<https://informedchoicewa.org/education/were-wa-lawmakers-deceived-about-measles-last-session-part-1/>

Is there perhaps a better way to protect those susceptible to severe disease and fatal COVID-19 outcomes, without sacrificing superior natural immunity for the >99.9% of the population who fully recover and develop natural immunity? Optimal nutritional support, early treatment protocols, and the benefits of natural immunity are tragically not part of public health's approach with any vaccine-targeted infection. With COVID, the neglect of these public health tools has cost many lives.

Third: as shown in our response to Criterion #1, the shots do not prevent transmission; any unethical attempt to use children as shields will fail.

As of January 6, 2022, the seven-day case rate in Washington State for ages 4-11 was 504.8 per 100,000. The seven-day hospitalization rate was 1.2 in 100,000. Compare this with the risk of myocarditis in vaccinated adolescents, which is 18.52 in 100,000 as seen in <https://pubmed.ncbi.nlm.nih.gov/34849657/>

Age Group	7-Day Case Rate	7-Day Hospitalization Rate	7-Day Testing Rate	7-Day Percent Positivity
Ages 4-10	504.8	1.2	--	--
Ages 11-13	558.1	0.7	--	--
Ages 14-19	731.8	1.8	--	--
Ages 0-11	480.7	2.3	--	--
Ages 12-19	692.4	1.5	--	--
Ages 20-34	869.9	10.7	--	--
Ages 35-49	724.5	12.0	--	--
Ages 50-64	444.2	20.0	--	--
Ages 65-79	227.3	30.9	--	--
Ages 80+	211.2	56.2	--	--

Cases, Hospitalizations, Testing and Percent Positive by Age

Graph from <https://www.doh.wa.gov/Emergencies/COVID19/DataDashboard>

Between January 4, 2020, and January 6, 2022, 573 children between the ages of 5-18 have died with COVID in the entire United States. CDC Deaths by Sex, Ages 0-18 years, <https://data.cdc.gov/NCHS/Deaths-by-Sex-Ages-0-18-years/xa4b-4pzy>

On December 31, 2021, Anthony Fauci stated, “ . . . [I]f a child goes into the hospital, they automatically get tested for COVID, and they get counted as a COVID-hospitalized individual, when in fact they may go in for a broken leg or appendicitis of something like that, so it's overcounting the number of children who are . . . hospitalized **with** COVID as opposed to **because** of COVID.” MSNBC interview, <https://twitter.com/TheEliKlein/status/1476917049435856925>

Vaccines and Related Biological Products Advisory Committee member Dr. Cody Meissner stated “[F]our per million [pediatric hospitalizations] certainly does not constitute an emergency, and there are significant questions about the safety of this product.” June 10, 2021, VRBPAC meeting transcript, p. 62.

<https://www.fda.gov/media/150815/download>

6. Vaccinating against this disease reduces the risk of person-to-person transmission, with transmission in a school or child care setting or activity being given the highest priority.

Having a large proportion of the population vaccinated with the antigen helps to stem person to person transmission of the disease (i.e., herd immunity). Even community members who are not vaccinated (such as newborns and those with chronic illnesses) are offered some protection because the high immunization rate results in the disease having less opportunity to spread within the community. Vaccinating children in school and/or child care can increase the percentage of children in these groups who are immune and thus reduce the risk of outbreaks of the disease in these groups and in the community at large. Special consideration of disease transmission in a school or child care setting or activity should be given the highest priority. For the purpose of this criterion, “activity” refers to school or child care extracurricular activities including, but not limited to, field trips, sports events, or other activities held on or off campus.

Do any of the COVID-19 shots fulfill this criterion? No.

The Pfizer, Moderna, and Janssen products do not prevent transmission, serious disease, or death.

The CDC director says that vaccines do not prevent transmission. “Fully vaccinated people who get a Covid-19 breakthrough infection can transmit the virus, CDC chief says,” *CNN Health*,

<https://www.cnn.com/2021/08/05/health/us-coronavirus-thursday/index.html>

“COVID-19 infections are increasing in Gibraltar, with 128 new infections reported on average each day. That’s 97% of the peak — the highest daily average reported on January 5. There have been 9,600 infections and 100 coronavirus-related deaths reported in the country since the pandemic began. . . Gibraltar has administered at least 108,323 doses of COVID vaccines so far. Assuming every person needs 2 doses, that’s enough to have vaccinated about 160.7% of the country’s population.” Reuters COVID-19 Tracker, accessed January 7, 2022,

<https://graphics.reuters.com/world-coronavirus-tracker-and-maps/countries-and-territories/gibraltar/>

Vaccinated people can still spread the Delta variant. Vaccination does not stop the transmission of COVID. “Testing a subset of low-Ct samples revealed infectious

SARS-CoV-2 in 15 of 17 specimens (88%) from unvaccinated individuals and 37 of 39 (95%) from vaccinated people.” Riemersma, “Shedding of Infectious SARS-CoV-2 Despite Vaccination,” <https://www.medrxiv.org/content/10.1101/2021.07.31.21261387v4>

Individuals who have been previously infected do not show a need to be vaccinated. This is consistent with Chapter 246-105-020 WAC: “fully immunized” means an immunization status where a child has proof of acquired immunity . . . ’ It is unreasonable to mandate that those with natural immunity be “boosted” with a vaccine when there is not scientific evidence that this practice is safe or effective in the long term. Boosting an individual’s levels of antibodies to the vaccine-induced spike protein—which no longer matches the dominant strain now circulating—is experimental. Also see Shrestha, “Necessity of COVID-19 vaccination in previously infected individuals,” <https://doi.org/10.1101/2021.06.01.21258176>.

Children have sustained and robust natural immunity after contracting COVID. Dowel, “Children develop robust and sustained cross-reactive spike-specific immune responses to SARS-CoV-2 infection,” *Nat Immunol* 23, 40–49 (2022). <https://doi.org/10.1038/s41590-021-01089-8>.

Long-term effects of the vaccine trials in children are unknown. Deaths in children are a fraction of the percentage of deaths in all other age categories. Kostoff, “Why are we vaccinating children against COVID-19?” *Toxicology Reports*, Vol 8, 2021, Pages 1665-1684, <https://doi.org/10.1016/j.toxrep.2021.08.010>.

Barnstable County, Massachusetts, had an outbreak amongst a population of tourists that was approximately 74% vaccinated, which indicates that vaccination does not prevent contracting or transmitting COVID. Brown, “Outbreak of SARS-CoV-2 Infections, Including COVID-19 Vaccine Breakthrough Infections, Associated with Large Public Gatherings - Barnstable County, Massachusetts, July 2021,” *MMWR Morb Mortal Wkly Rep*, 2021 Aug 6;70(31):1059-1062. <https://pubmed.ncbi.nlm.nih.gov/34351882/>.

Despite 100% vaccination rate, consistent testing, and quarantining, a research station in Antarctica still had an outbreak of COVID cases. “COVID-19 Outbreak Hits Research Station in Antarctica,” WebMD News Brief, <https://www.webmd.com/lung/news/20220103/covid-19-outbreakohitsoresearchostation-in-antarctica>

III. Implementation of the Criteria

7. The vaccine containing this antigen is acceptable to the medical community and the public.

It is possible to gauge the level of provider acceptance of a vaccine by querying state professional societies such as the Washington Academy of Family Physicians and the Washington State Chapter of the American Academy of Pediatrics. Vaccine uptake data are also available from the Department of Health to determine provider use of the vaccine. While there is generally a good correlation between the levels of physicians' and the general public's acceptance of particular vaccines, the TAG should consider additional ways of accurately gauging public acceptance of the particular vaccine. Adding an antigen to WAC 246- 105-030 related to a vaccine with poor provider or public acceptance would likely be resisted. Postponing the regulation until there is greater approval of the vaccine would assure more effective policy.

Do any of the COVID-19 shots fulfill this criterion? No.

There has never been more opposition from the medical and scientific community or the public to any type of vaccine or vaccine policy than there is to the COVID-19 products and policies.

EXAMPLES OF MEDICAL AND SCIENTIFIC OPPOSITION

- Over 15,000 members of the [International Alliance of Physicians and Medical Scientists](#) published a declaration resolving that healthy children shall not be subject to forced vaccination. They state:
 - Negligible clinical risks from SARS-CoV-2 infection exist for healthy children under eighteen.
 - Long term safety of the current COVID vaccines in children cannot be determined prior to instituting such policies. Without high-powered, reproducible, long term safety data, risks to the long-term health status of children remain too high to support use in healthy children.
 - Children risk severe, adverse events from receiving the vaccine. Permanent physical damage to the brain, heart, immune and reproductive system associated with SARS-CoV-2 spike protein-based genetic vaccines has been demonstrated in children.
 - Healthy, unvaccinated children are critical to achieving herd immunity. Natural immunity is proven to tolerate infection, benefiting community protection while there is insufficient data to assess whether COVID vaccines assist herd immunity.

Supporting Evidence:

<https://doctorsandscientistsdeclaration.org/home/supporting-evidence/#children>

- More than 500 scientists, medical doctors and health care and other professionals united as the [Canadian Covid Care Alliance](https://www.canadiancovidcarealliance.org). Their presentation *More Harm Than Good* reviews Pfizer's six-month data and reveals that Pfizer's COVID-19 inoculations cause more illness than they prevent. See the *More Harm than Good* video and PDF slides here: <https://www.canadiancovidcarealliance.org>

"It's clear that Pfizer - and the agencies overseeing their trials - failed to follow established, high quality safety and efficacy protocols right from the beginning. . . Any government that approved this medical intervention for its citizens should have ensured that the trial had used the appropriate clinical endpoints and high quality safety science. . . Any government official who possesses this evidence and continues to allow its citizens to be inoculated with a toxic agent is, at the very least, negligent."

1. The [Association of American Physicians and Surgeons](#), established in 1943, opposes COVID-19 vaccination mandates. In regards to children, AAPS states:
 - a. In the testing, only 1,518 children received the shots, and 750 received a placebo. This is far too few to see uncommon side effects, such as myocarditis/pericarditis, as Pfizer admits.
 - b. Follow-up was for two months in one group and only 2.5 weeks in another. The Pfizer application states that long-term sequelae of post-vaccination myocarditis/pericarditis in participants 5 to 12 years of age will be studied after the vaccine is authorized for children.
 - c. The children were not examined for mild, asymptomatic myocarditis, which might cause long-term damage, as by checking troponin levels or echocardiograms, or for blood clotting problems, as by checking platelet counts and D-dimers.
 - d. The only FDA-approved product, BioNTech's Comirnaty (not yet available in the U.S.) is required to do studies on myocarditis lasting 5 years.
 - e. Monthly safety report cards on the three available vaccines, which have different dosages, are supposedly required, but none have been produced or released.
 - f. The claim of 91% relative effectiveness against symptomatic COVID in children is based on 16 cases of COVID in the placebo group and three cases in the vaccinated group over the brief follow-up period. This is an absolute risk reduction of about 2%.
 - g. We do not and cannot know the long-term effects on cancer, fertility, or autoimmune diseases. "But we're never going to learn about how safe this vaccine is unless we start giving it. That's just the way it goes," stated committee member Dr. Eric Rubin, physician at Boston's Brigham and

Women's Hospital, immunology professor at the Harvard T.H. Chan School of Public Health, and current editor-in-chief of the New England Journal of Medicine. The alternative to giving a product to most of an entire generation is animal studies or restricting use to a defined group most likely to benefit, with close follow-up.

- h. The dosage for children is one-third the adult dose. Dosage in pediatrics is generally determined by weight. Not all children weigh the same, and their weight does not triple between age 11.9 and 12.0 years.
 - i. The COVID products are not shown to interrupt infection and transmission. Masking and distancing are still being recommended or required for adults. Thus, hopes for a return to normalcy once vaccinated are misplaced.
 - j. To give truly informed consent, parents need complete information about possible side effects, such as the outcome for Maddie de Garay, a 12-year-old whose public-spirited parents enrolled her in a trial. Post-shot, she experienced excruciating pain and a 2-month hospitalization, and is now in a wheelchair. Pfizer has not acknowledged a connection to the shot, nor did it fully disclose her injuries in it. The reaction may be "extremely rare," but many would decline to take even a 1-in-1 million chance of this outcome.
 - k. The government has already ordered 68 million doses, so authorization is anticipated, and likely will be followed by mandates.
 - l. Several Nordic countries have paused the use of COVID vaccines in persons under the age of 30. Persons at low risk for COVID complications are more likely to die from the shot than from COVID.
 - m. Dr. Harvey Risch, Yale epidemiologist, stated that he would home-school his children if public schools mandated this vaccine.
 - n. No one should administer a COVID shot to a child unless parents have given fully informed, completely voluntary consent, without threats or inducements.
 - o. SOURCE:
<https://aapsonline.org/aaps-statement-on-covid-shots-for-children/>
2. The [Physicians for Informed Consent](#) have compiled a Pfizer Vaccine Risk Statement for children that highlights FDA, CDC, and Pfizer clinical trial data finding:
- a. The clinical trial found there were zero cases of severe COVID-19 in children of any age who did not receive the vaccine. In contrast, the trial found that the vaccine causes severe (grade 3) and grade 4 systemic reactions in children.

- b. The clinical trial indicates that vaccine efficacy declines significantly in less than six months. Although a booster dose of the vaccine is authorized for individuals 16 years of age or older, the clinical trial states that efficacy was not evaluated for Phase 3 BNT162b2 booster group participants. Instead, vaccine efficacy was inferred based on antibody levels observed in only about 300 vaccinated subjects over a one-month time period.
- c. The clinical trial provided no evidence that the vaccine prevents asymptomatic infection or transmission of SARS-CoV-2 or COVID-19. In addition, recent studies have observed that a significant proportion of severe, critical, and fatal cases of COVID-19 occurred in vaccinated individuals.

<https://physiciansforinformedconsent.org/physicians-for-informed-consent-updates-its-pfizer-covid-19-vaccine-risk-statement-analyzes-new-safety-data-for-children/>

- 3. The [World Council for Health](#), whose leadership includes Dr. Tess Lawrie (PhD, MD, Founder, Evidence-Based Medicine Consultancy LTD, Bath, United Kingdom, 10-year Senior consultant to the WHO supporting health policy recommendations for countries globally), issued a statement in December 2021:
 - a. There is now more than enough evidence to declare the novel Covid-19 vaccines unsafe for use in humans. Victim testimonies and adverse reaction reporting systems have revealed millions of adverse reactions to the experimental vaccines, including life-changing injury and death.
 - b. The inoculations are capable of causing immeasurable harm to those who received them, with children being more likely to die from the Covid-19 vaccines than from actual SARS-CoV-2 infection.
 - c. World Council for Health anticipates that unprecedented humanitarian efforts will be essential to assist the people harmed by this global vaccination experiment, due to the known and unknown harms.
 - d. The World Council for Health demands an end to this crisis and hereby declares it illegal and unlawful for anyone to participate, directly or indirectly, in this harmful experimental vaccination programme. The World Council for Health declares individuals, governments, and other corporations will be held liable for their involvement.
 - e. World Council for Health Calls for an Immediate Stop to the Covid-19 Experimental “Vaccines” DECLARATION:
<https://worldcouncilforhealth.org/campaign/covid-19-vaccine-cease-and-desist/#full>

SOURCE: <https://worldcouncilforhealth.org/news/2021/12/covid-19-vaccines/14001/>

4. Paul E Alexander MSc PhD, Howard C. Tenenbaum DDS, Dip. Perio., PhD, Dr. Parvez Dara, MD, MBA: “We must not expose our children to ‘unnecessary’ harm. We must not expose them to a substance that has not been tested on children (or plan to be) in the way it should be and for as long as necessary. We must not expose children to a vaccine that based on their risk, is absolutely not needed. Moreover, they can become infected naturally, if their immunity is needed.”
<https://www.aier.org/article/why-we-must-not-be-forced-into-vaccinating-our-children-from-covid-beware/>
5. Dr. Robert Malone (MD, Northwestern School of Medicine, MS, UC San Diego and Salk Institute Molecular Biology and Virology Laboratories, Giannini Postdoctoral Research Fellow, UC Davis, Harvard Medical School fellow -- Global Clinical Research Scholar (2016), original inventor of the mRNA vaccine platform used in the Pfizer and Moderna COVID-19 vaccines as well as the DNA vaccine platform used by Inovio): Interview in which Dr. Malone voices his grave medical and scientific concerns for the use of any of the COVID shots, especially in children:
<https://unityprojectonline.com/news/dr-robert-malone-md-on-the-joe-rogan-experience/>
6. Dr. Peter McCullough (MD, FACC, FAHA, FASN, FNKF, FNLA, FCRSA, Chief Medical Advisor, Truth for Health Foundation; President, Cardiorenal Society of America; Editor-in-Chief, Reviews in Cardiovascular Medicine; one of the most highly published medical specialists in practice today and an authoritative commentator for major media on COVID-19). Dr. McCullough has been interviewed hundreds of times and testified to numerous legislatures and to Congress. He is a tireless proponent for early treatment to save lives, and although he at first administered the EUA shots to his patients, as information began to emerge, he stayed informed and up-to-date. He no longer supports use of any of the existing COVID-19 shots. His interview by Joe Rogan is extensive and can be found here:
<https://unityprojectonline.com/news/dr-peter-a-mccullough-on-the-joe-rogan-experience/>

In an [interview in August 2021](#), Dr. McCullough reviewed his five main points of education:

- a. COVID-19 is NOT spread asymptotically
- b. Asymptomatic people should not get tested

- c. Natural immunity is robust complete and durable
- d. COVID-19, no matter what variant, is easily treatable at home
- e. Current COVID-19 vaccines are obsolete and should be considered unfit for human use. “They [the vaccines] do not cover the new variants; patients are failing on these vaccines. They’re being hospitalized and getting sick despite having had the vaccines . . .the vaccines at this point in time have amounted to record mortality and injury and should be considered unsafe and unfit for human use.”

EXAMPLES OF U.S. PUBLIC OPPOSITION

Evidence that half the country refusing; people willing to lose jobs rather than comply; large organizations of professionals publishing position papers; example of LA Unified School district; Enumclaw example?

<https://www.cityofenumclaw.net/DocumentCenter/View/6670/Res-1734---Covid-19-Vaccine-Verification-Discrimination>

Less than half of parents support a requirement for middle and high school students to be vaccinated for COVID. "About One in Five Americans Remain Vaccine-Resistant," Gallup, August 6, 2021,

<https://news.gallup.com/poll/353081/one-five-americans-remain-vaccine-resistant.aspx>

Healthcare workers are willing to lose their job rather than take the COVID vaccine.

"Roughly 3,000 hospital workers lost jobs over Washington's COVID-19 vaccine mandate," KING 5 News, November 17, 2021,

<https://www.king5.com/article/news/local/washington-hospitals-lose-roughly-3000-workers-over-covid-19-vaccine-mandate/281-b0ff14de-27b6-4b0a-bcca-ed924c314ca0>

As of October 19, 2021, nearly 2,000 state workers chose to be fired rather than take the vaccine. "Nearly 1,900 Washington state workers quit or are fired over COVID vaccine mandate," *The Seattle Times*, October 19, 2021,

<https://www.seattletimes.com/seattle-news/politics/nearly-1900-washington-state-workers-quit-or-are-fired-over-covid-vaccine-mandate/>

There have also been many stories in the news describing our service members who are being discharged secondary to their declination of the shots.

8. The administrative burdens of delivery and tracking of vaccine containing this antigen are reasonable.

Many institutions and individuals are involved in implementation of the rule when the Board adds a new vaccine to WAC 246-105-030. These include: the Department of Health, the Department of Social and Health Services, the Office of Superintendent of Public Instruction (OSPI), local health jurisdictions, schools, child care, health plans, health care providers, and families. For each of these key players, there are issues that affect the feasibility of implementing an immunization recommendation. For example, introduction of a new vaccine can result in schools conducting more parental follow-up and making changes to record and information systems—this in turn can impact school staff workload. Assuring that a reasonable burden of work is present will enhance the effectiveness of the policy. The TAG includes representatives from affected parties such as OSPI, schools, and child care when assessing an antigen against this criterion.

Do any of the COVID-19 shots fulfill this criterion? No.

The burden on school nurses for tracking COVID cases and for managing all the COVID measures is already unreasonable. ICWA board member Heidi Hartnell is a teacher in Washington State and can speak to the amount of time schools already spend tracking COVID cases and close contacts. If the requirement of vaccination is added to the existing required measures, this would create an extensive amount of maintenance and updating of immunization records. She says, “With the demonstrated waning efficacy of the COVID vaccination in adults, it would seem that this would also be true with children. If children are required to be “up to date” with a booster every six months, this will be a huge burden on schools as vaccination records will constantly need to be checked and updated. Currently, a majority of the required vaccinations are completed by the time a child enters kindergarten and these forms do not require frequent updating. However, if the COVID shot and subsequent boosters were to be added, this would place a hardship on already wearied teachers and school personnel. Ultimately these shots do not prevent contracting or transmitting the virus, and so this work achieves nothing in the public health sense.”

The only thing that makes sense, given that >99.9% of children are at zero risk from COVID, is to simply enforce the “stay at home if symptomatic” rules that have served public health well for decades. We can never achieve, nor would we want to achieve, zero exposure schools. Children’s immune systems need exposure to the microbial world, including to viruses, to properly develop and protect them as adults. This is just as true for COVID, which has become endemic, so children will be encountering the virus and mutations for the rest of their lives. More than 140 studies demonstrate that natural immunity will serve them well and far longer than the shots, and it is their

parents who should make the risk-benefit decision, not the State of Washington. "144 Research Studies Affirm Naturally Acquired Immunity to Covid-19: Documented, Linked and Quoted," Brownstone Institute, October 17, 2021.

<https://brownstone.org/articles/79-research-studies-affirm-naturally-acquired-immunity-to-covid-19-documented-linked-and-quoted/>

Public health would be even better served if the BOH would acknowledge natural immunity, and support and promote early treatment protocols, so that everyone of all ages and of any vaccination status could see better outcomes.

<https://www.cdc.gov/media/releases/2021/s1227-isolation-quarantine-guidance.html> -

9. The burden of compliance for the vaccine containing this antigen is reasonable for the parent/caregiver.

Parents and caregivers are often involved in obtaining vaccines for children. This can include: transporting children to medical appointments, taking time off of work for medical appointments, maintaining the child's immunization records, etc. When a vaccine is required for child care and/or school entry it affects the health decisions that parents make on their child's behalf because parents must, at the very least, take the required vaccine into account.

Do any of the COVID-19 shots fulfill this criterion? No.

Considering the risks discussed in Criterion #4 above, the burden of compliance on parents is unacceptable.

Considering that any injury sustained by a child is borne completely by the parents because the manufacturers are shielded under the Public Readiness and Emergency Preparedness (PREP) Act, the burden of compliance is unacceptable.

<https://aspr.hhs.gov/legal/PREPact/Pages/default.aspx>

The shots are available everywhere, even grocery stores often without an appointment, so it is easy for most parents to find an opportunity to get their child a shot if they so choose, but for those parents who choose to opt out of a school vaccine requirement, the burden is out of balance.

Parents can't go to Safeway or Rite Aid for an appointment with a practitioner to get the required risk-benefit consultation and signature. They must make an appointment with a practitioner, take time off work, arrange transportation, etc. That first step is now the most burdensome. For the past several years, it has been increasingly difficult for parents to find any practitioner willing to give them the required risk-benefit consultation. Many doctors and clinics are kicking families out of their practices who do not vaccinate, or who do not fully vaccinate according to the CDC schedule. This has nothing to do with health or protection and everything to do with the financial incentives built into the

insurance and public health systems that reward high vaccination uptake. This practice is supported by the American Academy of Pediatrics, which has critical conflicts of interest associations with the pharmaceutical and medical industries. “The AAP recently issued a clinical report that stated it is an “acceptable option for pediatric care clinicians to dismiss families who refuse vaccines”

<https://www.infectiousdiseaseadvisor.com/home/topics/prevention/new-aap-policy-on-patient-dismissal-for-vaccine-refusal-may-erode-solidarity-among-pediatricians/>

The BOH’s criterion is based on the assumption that “a process exists to opt out of immunization requirements by children attending either child care or school.” If parents are unable to find a practitioner willing to provide the required risk-benefit consultation and sign an exemption form or letter stating that they have done so, then that opt-out does not exist.

And finally, a tremendous burden exists in the coercive aspect of any vaccine requirement. Parents who opt their children out of one or more vaccinations experience emotional and psychological stress because they know they face scrutiny by school staff, by health care providers, by surveillance systems, as well as cultural pressure. Children who lack one or more vaccinations are singled out at various times, excluded from school and extracurricular activities. If a vaccine is NOT on the schedule, a parent is able to choose what is best for their child without the added stress. It is an unreasonable burden to stress entire families with a requirement that should be a personal medical decision. It is incomprehensible that the Board would even consider such a requirement with products that cannot prevent infection or transmission.

BOARD CRITERIA FRAMEWORK:

The only purpose for which power can rightfully be exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant.” Harm to others cannot be prevented by requiring children attending school to take this vaccine.

Subject: Child COVID shots

External Email

As you are preparing to answer the questions before you as the BOH TAG regarding COVID "shots" for school children I implore you to Please, Please, Please study the document sent to you by Informed Choice WA responding to all 9 criteria. These "shots" fail the test of all 9 of the criteria.

"It's clear that Pfizer - and the agencies overseeing their trials - failed to follow established, high quality safety and efficacy protocols right from the beginning. . . Any government that approved this medical intervention for its citizens should have ensured that the trial had used the appropriate clinical endpoints and high quality safety science. .

..... Any government official who possesses this evidence and continues to allow its citizens to be inoculated with a toxic agent is, at the very least, negligent.....

Adding these shots to the child vaccine regimen flies in the face of science, medical freedom, informed consent, parental rights, and several well know health and experiment doctrines, ie; Barrington, Nuremberg et al.

This is not science. This is not safety. This is not in the best interest of vaccine recipients. This is using Americans, especially our children who are most impacted, as unwitting test subjects. This is human experimentation without informed consent. This is removing the parents from making the healthcare decisions for their children.

Remember your own criteria.....

BOARD CRITERIA FRAMEWORK:

The only purpose for which power can rightfully be exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant."

Harm to others cannot be prevented by requiring children attending school to take this vaccine.

In closing:

I challenge your group to make the right decision.

I challenge you to step up to the plate and do something that will positively impact the children in our state for the remainder of their lives.

Your decisions will ultimately impact the rest of our nation's children and possibly children around the world.

Dare to be a hero for all, do not allow these shots to be included in the child vaccine regimen.

Wayne Howerton

Subject: Re Vaccine Requirement for Kids

External Email

Hello - my name is Christy Owens and I have a high schooler, middle schooler and kindergartner in WA public schools.

In 2017, my youngest son was diagnosed with leukemia at the age of 16 months. This turned our world upside down. We spent the next 6 months in intense chemotherapy treatments, and the next 3 years in maintenance chemo. This March we are so happy to say that he will officially be declared a survivor!

In the first 6 months, we definitely had to isolate. We had our own "new normal" to get used to. Any virus, cold or bacterial infection had the potential to kill him. We isolated, we limited visitors, we sanitized regularly. We limited our time in public.

During this time, we refrained from seeing my sister's family who is mostly unvaccinated—opting to spend time together in a less risky season "just in case." I want to note that I did NOT expect others to accommodate our fears and scary realities. I did not ask her family to vaccinate as a requirement to see us ever again. We did not go to the grocery store and expect everyone to be masked—that would be ridiculous—maniacal even.

We are currently restricting and mandating everyone for the safety of a few, and this needs to stop.

Most children are not at risk from this disease. Did you know cancer is the number one disease killer of children? It is not COVID. How much time and thought have you given to pediatric cancer prevention? That's about how much time and thought COVID should get from you too. Do not buy into the hype.

Please stop with the mandates and restrictions for a population of people who are not at risk. You will not truly be able to protect the vulnerable—you will only serve to restrict the healthy.

Instead of vaccine mandates, please consider creative ways to serve vulnerable populations who are at true risk. Extending at home learning and other creative measures would be so valuable to these groups.

We know that it's tempting when you have a hammer sometimes everything looks like a nail—but the same treatment should not be standard of care or universal. We are not all the same.

I pray that God gives you creative solutions that are elegant and meet many needs and are well accepted by most if not all. Vaccine mandates are not this solution.

In the meantime please stop COVID mandates—hammering this issue is only serving to divide.

We are pulling for you to make good decisions that affect us all.

Thank you for listening,
Christy Owens

I'm a concerned parent and was wondering why the VAERS data is being completely ignored. According to this database (which was created after the pharmaceutical companies garnered complete immunity from all liability when their products caused harm with the passage of the 1986 ACT). According to this data these are NOT safe or even effective vaccines. In fact they are the MOST dangerous vaccines that have ever been developed and forced on the population.

The VAERS data was intended for use to identify safety indicators, for children in particular the risks incurred by these experimental shots are greater than the benefits. With no long term safety data available I believe it is more than unwise, but very dangerous to proceed with inoculating every U.S. child.

If you ignore this data I cannot believe you are innocent of simply making a mistake....this would indicate a strong inclination towards malice as you are knowingly placing children in harm's way in order to make yourselves feel safer. At no time in history have we sacrificed children to protect the elderly....this has always been the other way around.

Many Germans felt they too were just doing their job so long ago, in the end that did not save them from prosecution and ultimately execution. Those who intentionally harm children and claim ignorance or that you were 'just doing your job' may ultimately face the same end. Think before you continue on this dangerous path...Whatever the gov't is paying you for your compliance won't be enough, the same gov't you're counting on now will leave you under the bus to cover their own corrupt actions. Remember Benghazi...

COVID Vaccine Data (openvaers.com)

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fopenvaers.com%2F covid-data&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Ce3a570f0383146f583a108d9eb8e75c5%7C11d0e217>

Now that you've seen the data, you can no longer claim you didn't know.

The Covid shot is not necessary for children. It has been proven. If they make it mandatory for students in Washington my three children will no longer attend public school and my family will strongly consider selling our three businesses and moving out of state. We will not be strong armed to do something that is not medically necessary for our kids.

Hello, I am sending this email to you out of concern for those who are desiring to have children vaccinated for covid 19. I am greatly concerned by this because there is very little research done about this. No one knows, not doctors or pharmaceutical companies what the long term risks could be. Please consider all of this before a decision is made that could be of some serious health risks which could have long lasting emotional issues as well to our children. Thank you for your time in reading my email. Have a wonderful day.

Hello Board Members,

It has come to my attention that WA Board of Health will be discussing Covid-19 shot mandates for schools and recommendations for forcible quarantine and/or detention of those that disagree with policies. I request that you abandon the plan of forming a technical advisory group to explore COVID19 mandates and adopt a new rule of requiring products to have completed Phase 3 clinical trials before they can be added to list of school requirements.

One definition of insanity is to repeat the same mistake over and over again and expect different results. For almost 2 years we have attempted to follow the health recommendations of washing, masking, distancing, testing, isolating and vaccinating. By now it is apparent that the virus is "gonna virus" regardless of measures attempted. Thankfully, SARS CoV2 is acting in similar manner as all other viral pandemics and becoming more "virulent" (spreads easier) but less deadly. Real immunity is achieved with exposure and recovery as is evidenced by fact that those infected with SARS in 2002/3 cannot become infected with SARS CoV2 today! In contrast, Covid19 has managed to find a way to escape the vaccine as is evidenced by the incredibly high numbers of vaccinated and even boosted individuals getting sick and testing positive. Surely this fact has not escaped your knowledge!

As Health Board members, you are obligated to provide us with facts that support any and all recommendations or requirements.

1) what is the current rate of mortality for COVID19 infection and stratified according to age groups?

2) point to ANY measures that have reduced the numbers of fatalities (cases are not fatalities).

3) what is rate of all cause mortality in WA in 2020 and 2021?.....did the measures imposed reduce the number of deaths from prior year?

4) provide evidence of asymptomatic spread of SARS CoV2.

5) provide safety studies for masking children and randomized clinical trials for masks preventing spread of lab-confirmed upper respiratory viruses (not modeling of masks on mannequins).

6) make public the accuracy of testing - what is the rate of false positives and false negatives of tests and were results determined by manufacturers of the tests or unbiased 3rd party investigators?

7) provide evidence that the vaccines prevent infection and transmission and that they improve health of individuals who receive them compared to those who do not.

8) explain why so much focus on eliminating this 1 virus when human immune systems have successfully protected our growing population since the beginning of time? Are you aware that some viruses are beneficial for humans and can protect against various forms of cancers and heart issues? Did you know that your human virome contains over 380 TRILLION viruses?

Unfortunately, I do not trust that you have carefully investigated and logically determined adequate and measurable health remedies for which you are able to provide evidence. Before doubling down on measures that seem to HARM more than they HELP the overall health of citizens, please determine and make public the evidence to justify any policies.

Regarding mandating shots, know that the clinical trials will not be completed until 2023. Know that WA State has a legal definition of a vaccine that the C19 shots do not fulfill as they were never part of a living microorganism.

"Vaccine" means "a preparation of killed or attenuated living microorganisms, or fraction thereof, that upon administration stimulates immunity that protects against disease and is approved by the federal food and drug administration as safe and effective..."

<https://app.leg.wa.gov/RCW/default.aspx?cite=70.290.010>
<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fapp.leg.wa.gov%2FRCW%2Fdefault.aspx?cite=70.290.010>

Finally, do no harm! You cannot possibly know or care more about the health of children than do the parents of Washington children! Myocarditis is just one of the side effects that people are reporting. Heart muscle doesn't regenerate and is an

unnecessary injury to those who may suffer with for the rest of their life. How many others are now injured? What is the real rate of adverse effects following these EUA products and how can you determine if the safety studies have yet to be completed and there is no transparency of adverse event reporting?

Furthermore, how necessary or even safe is it to give a vaccine to a person who already has immunity to the pathogen? Many children by now have been exposed to the virus and have developed immunity without difficulty. Why consider a mandate for those not at high risk for adverse outcome should they become infected but who carry unknown risks of adverse reaction with getting the shot?

I look forward to hearing these concerns addressed and evidence for any and all recommendations to be presented on January 12.

Thank you.

My name is Teresa Moyer a long time Washington resident in Vancouver Washington. Please do not go forward with this mandate of vaccines for all people and especially children. There is no data or research supporting factual scientific data that these vaccines are safer then natural immunity or early treatments. Getting everyone vaccine will not stop transmission. These vaccines are causing genocide and adverse reactions off the charts. Please stop vaccines.

Dear Chairman Grellner:

The ending comments by the board at today's meeting were both disingenuous and unprofessional. The analogies about measles and tuberculosis were amateurish and lacked sincerity. The comments were intellectually lazy for such an educated board. These comments did more to erode your board's credibility than it did to enhance it. I recommend the board look at their comments introspectively.

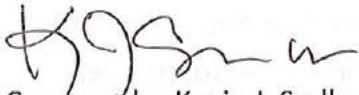

To make comparisons of measles and tuberculosis (TB) to HIV/AIDS and COVID19, damaged your credibility. As a TB converter, the Hospital Corpsman who gave it to over one hundred of us on my ship was placed into forced isolation and quarantine at the base hospital. You do not put healthy people into quarantine, you put the infectious. But you know that. Secondly, people recognize the dangers of smallpox, polio, and measles. Thus, vaccination programs at the time was welcomed, as the benefits outweighed contraction of those diseases. My father, who was my school principal, told me the reason why most people have the smallpox inoculation scar on their left (non-dominate) arm, was because the medical community at the time was fearful of the vaccine and thought an adverse reaction might require an amputation of the inoculated non-dominate arm. But again, the people took the risk to avoid the danger of the diseases as the benefits of not contracting smallpox outweighed the risks.

Therefore, it is obvious that the people can do risk analysis, they do it every day. They can find the factual data on the internet and see the overreach by the government on this issue. The risks presented by the research and analytical data doesn't justify the overreach, which explains the blood bath you received on both public comment periods as the representatives of the government. My recommendation is that you recall these comments and concerns as you deliberate.

You might also want to stop the stigmatizing of the electorate regarding vaccination status and pass that onto the elected leaders in which you report. The HIV/AIDS related comments made good points about stigmatizing groups and their medical decisions. The "our body and our choice" public comments also made good points. The current rate families are exiting public schools for home schooling or private schools will accelerate if you decide upon requiring the SARS/COVID vaccination for school attendance. Both the Cato Institute and Seattle Times have articles on the public-school exodus last year. The parents are acknowledging the SARS/COVID data for those age-groups does not support the vaccination decisions by the government or in your case, pending decisions.

I will be forwarding this letting to my elected representatives and a few legislators I personally know, so they can review the recorded board meeting today and come to their own conclusions of the board's comments.

Sincerely,

Hello,

I'm writing to respectfully request that Washington please add the COVID -19 vaccine to the list of required vaccines for school attendance. We hope the state reflects Science and common sense Public Health practices in their decision-making. We'd love to feel our child is as safe at school as we can support him in being , and look forward to moving on from this pandemic.

Thank you.

Subject: Vaccine for school attendance

External Email

Since Covid 19 and its variants are not vaccine preventable diseases, the alledged vaccine doesn't qualify for the list.
Current data on the benefit to risk ratio of the vaccine reveals that vaccination of school age children is pointless, or even detrimental.

By making vaccination a requirement, the Washington State board of health creates a liability for any harm the vaccination causes.

Respectfully submitted,

Ron Frantz

Strictly regular use of ivermectin as prophylaxis for COVID-19 leads to a 90% reduction in COVID-19 mortality rate, in a dose-response manner: definitive results of a prospective observational study of a strictly controlled 223,128 population from a city-wide program in Southern Brazil

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Femail.mg2.substack.com%2F%2FHXgsEoUKaccIuWK2tDjIcvDAryO_z7tmUMiEK-GrqouDFRcUz7VlkptrkHXc0MV8Sgea8Xc7AWzdIzJPkxi7MaGlrab-qlxRd8zYgDnVc07Ntu-eGeguhSvF_0kOGPNQ8kBQfSDYKO4dwZxAQkLDXaclgFk9wKKG3TqMBhV-Yj5TxMarR61buYn3G_9G_TiONmNByOaxEvM2YqXj_2BpJwh2GgSf9c-anan-1BnX3UPWJEWnu3aUP6CpLmooestpe5we_lxyUtZffvz6_vWtm7VHsEXXpEHPjHLY3byUxX93QsoVvKuEQXyuE-Bfbk2eq&data=04%7C01%7Cwsboh%40sbob.wa.gov%7Cc64d973725ff4c88a7f208d9ea641233%7C11d0e

This important preprint needs to hit alternative and mainstream media now.

Background: Previously, we demonstrated that ivermectin use as prophylaxis for COVID-19 was associated with reductions in COVID-19 infection, hospitalization, and mortality rates, and in the risk of dying from COVID-19, irrespective of regularity and accumulated use of ivermectin, in an observational, prospectively obtained data from a strictly controlled city-wide program in a city in Southern Brazil (Itajaí, SC, Brazil) of of

medically-based, optional use of ivermectin as prophylaxis for COVID-19.

In this study, our objective was to explore the data obtained from the program to evaluate whether the level of regularity of ivermectin use impacted in the reductions in these outcomes, aiming to determine if ivermectin showed a progressive dose-, regularity-response in terms of protection from COVID-19 and COVID-19 related outcomes.

Materials and methods: This is a prospective observational study of the program mention above, that used ivermectin at a dose of 0.2mg/kg/day for two consecutive days, every 15 days. We obtained and analyzed the data regarding the accumulated dose of ivermectin use, in addition to age and comorbidities, to analyze the patterns of reduction of COVID-19 infection, hospitalization, and mortality rates, and risk of dying from COVID-19, according to the regularity and amount of ivermectin used in a 5-month period.

Following definitions of regularity, we considered as strictly regular subjects that used at least 180mg of ivermectin (180mg = 30 tablets), and as sporadic users subjects that used 60mg (= 10 tablets) or less during the 5-month period.

Comparisons between subjects that did not use ivermectin and these two levels of regularity of ivermectin use were performed. Analysis of the intermediate levels of ivermectin use are present in the supplement appendix of this study. To analyze hospitalization and mortality rates, we utilized the database of COVID-19 infections of all participants, from Itajaí and outside. To analyze COVID-19 infection rate and risk of dying from COVID-19 we utilized the Itajaí city database.

Propensity score matching
<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Femail.mg2.substack.com%2F%2FDMU24_pDMjLNuUVTaUrUbYc71kyQ3J7RReBWScnxYAESo5G1TlneRsEdM6rqSnbhSzIL6prQJE7YPEegIppwne_g_XpPCQLEv5AvXICEuSBWNpr-vViX93OqJPHbPRgdb9u2p4BPbSeH6ADHqrZT4sbieC89QluXmfdkD1u76DoihES6qD-l6I9Sg-lZsw2h398_UAFUvN49e65gooa7eHTPhS3ES8ZZd3oMgo6czb0w_hoqdaTGa19CzbM5XtzS1xenMadDe00DbXS9B9ar-y3IB-5Kqh7j_bxLQdImgHtExmdXH9nVDglq36FTGuW4cD6udF35m_JH03tvYqLz9Bakz3W5s5KsP1GHLnB0fwEj5K9>
(PSM) was employed, followed by multivariate adjusted analysis for residual differences (doubly adjusted analysis).

Results:

* Of the 7,345 cases of COVID-19, 3,034 occurred in non-users, 1,627 in sporadic users, and 289 in strict users, while the remaining cases occurred in the intermediate levels of ivermectin use. Strict users were older ($p < 0.0001$) and non-significant higher prevalence of type 2 diabetes and hypertension.

* COVID-19 infection rate was 39% lower among strict users [4.03% infection rate; ($p < 0.0001$)] than in non-users (6.64% infection rate), and non-significant 11% reduction compared to sporadic users (4.54% infection rate) ($n = 1,627$ in each group; RR, 0.89; 95%CI 0.76 – 1.03; $p = 0.11$).

* Hospitalization rate was reduced by 100% in strict users, compared to non-users and to sporadic users, both before and after Propensity score matching ($p < 0.0001$).

* After Propensity score matching, hospitalization rate was 35% lower among sporadic users than non-users (RR, 0.65; 95%CI, 0.44 – 0.70; $p = 0.03$).

Research and clinical practice show that using re-purposed drugs for Covid-19 have huge benefits. These include multi-drug, multi-staged treatments for Covid-19 disease that prevent severe disease, decreases hospitalization rates and decreases death. It is time our government and state licensing board recognize this and let physicians practice medicine.

'Off-label' drug use: an FDA regulatory term, not a negative implication of its medical use.

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Femail.mg2.substack.com%2F%2FEBwD170msY5zAUgurraVA8h-TGv0rsUtX4hed4Ix8rRSCzmDN8Yz4TmH3gXH-ayENMFL5W5id4QI2YOFN5Rzy0BW-2xtr4_u5yF-MfF_gkCznyLNa6I5PumyvfhCNWOy0wZHEq1gApMp3PZSUAWhuWfOdRP33mhB-_01B5XUQ7K0CFqPqTbnX9RviRT7l-oeoQq8Lpe67xrJR-zpyLGdI2Q3rRBu3e227-vEuECGgraG0TXLIZR8YMMgDZO3zMtK3bG-M5ogb9gQIW35JLei5hT-AZIXhVI&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Cc64d973725ff4c88a7f208d9ea641233%7C11d0e>
Int J Impot Res. 2008 Mar-Apr;20(2):135-44. doi: 10.1038/sj.ijir.3901619. Epub 2007 Nov 15. PMID: 18004389.

Highlights:

* A doctor's decision to inform the patient of the 'off-label' status of the prescription is not relevant to the physician's standard of care for an informed consent case.

* The FDA has specifically stated that its procedures and requirements have no effect on the practice of medicine and that the FDA does not prohibit doctors from prescribing drugs in an 'off-label' manner.

* The FDA's approval of a drug is immaterial to the effectiveness in the drug's 'off-label' use. In fact, prescribing medication in an 'off-label' manner can constitute the standard of care in many cases.

* A doctor's duty is to practice medicine and treat his patient, not inform the patient of the FDA's non-medically related labeling. Therefore, doctors should not be branded with the additional duty of disclosing non-pertinent information, such as the FDA's medically irrelevant distinction, to their patients

*It is estimated that 21% of all prescription drugs are prescribed "off-label."

For fun, I took the countries that reportedly use Ivermectin country-wide and compared them to the USA, Israel and Sweden. I chose a three month cut-off, although the results were extended further. I did this because I don't know when some of the countries began ivermectin use.

Can you guess who now has the highest death rates per million? Yeh -

1. USA
2. Israel
3. Sweden

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Femail.mg2.substack.com%2F%2FBsrDMOIAQpNwp9Ovb4BVfct2bNnH8rEzFZaUP3pPpXanmupnBx3hXVaoFXJ3FMhT8JoRoajEsmuux4qrLpRpzgYBuP-wanKkhxbOCK0oQ6p6ay5FYO3KQBgjGYubOCMXsjBmSgrsb2Bw-QHSg4RvyJ0XoVv2sdS8P-vUgP5s4H4dy2FKNew0ubS0UNrNAszNU9zxta1PTg_z4fTv0a0nJt_-8TntOS4ZSwje0eKkAe6u4IQg_QfgJ05Q93AtaPveAuLVOsd4aQ3tGJfQjx6o33IjQcpRsaHQwWzmb4rmXe65W>

Notes: I included - India, because although not all regions use Ivermectin - although the most populated due. Likewise Africa - which many nations treat with ivermectin prophylactically and these world maps do not break down Africa by Nations (weirdly imperialistic). I did not include Bulgaria, as although they use ivermectin - their death rate numbers are skewed for other reasons not worth delving into.

But it is still an interesting snap shot as to where much of the world is right now.

In regards to the agenda section 5 stating that this Covid vaccine prevents transmission from person to person is a lie! It has been well documented that even people who are fully vaccinated are still getting and giving Covid to others. Fully vaccinated people are also still dying in hospitals due to their other comorbidities. Unvaccinated people who are typically healthy have less than a one percent chance of dying from this. Children have even less of a chance of getting any extreme illness. This vaccine has no business being mandated! COVID-19 is not a threat to the common person. It is only a threat if you are old, obese or have other medical issues. Healthy average people do not need this vaccine!

Thank you,
Samantha Grant

Hello,

On the agenda notes for the Feb 10 technical meeting, #5&6, mentions that the vaccine prevents the disease, and that it reduces the transmission.

I'm confused as I thought it had been established that the vaccines only job was to lessen the severity of covid to the person that contracts it and that vaccinated people can still carry, transmit and become ill from Covid.

With that in consideration, although I am vaccinated, I do not agree with making it a requirement for schools or work places.

Thank you

Good morning,

I have a couple questions.

Why did you change your agenda?

You put out your agenda, then when people (understandably) became upset, you proceeded to put out more messages about misinformation when you were the one spreading it?

It did not go unnoticed what you have done. Many people wrote to TV stations and other news outlets hoping someone would pick up this story nationally. We will continue to monitor your actions and forward them as appropriate.

Regards,

Pam

Dear tag group,

I am a grandmother and I have three beautiful grandchildren. I am concerned about introducing the experimental MRNACovid shot to young children. I don't understand why you are considering this shot to be helpful? As I understand the MRNACovid shot no longer prevents or provides a person from the possibility of contracting Covid. There have been cases of Myocarditis in young children caused by this vaccine. The survival rate from Omicron is 99.99% for young children. I just don't understand how this shot can be helpful or beneficial to young children? I hope you will use good sense and kindness when making your decisions. The youth is so precious and our hope for the future.

Thank you,

Subject: Gene Therapy injections for children

External Email

We, as parents, reject the gene therapy injection which is being proposed for school admissions and media outlets. We will not comply with the forced injections. If the gene therapy injections were successful, much like the common vaccines, measles, chicken pox etc. then injections would be successful. These gene therapy injections, which are NOT vaccines, cause great physical harm to individuals and are not preventing the spread of covid. Hence, the need for many injections, boosters, masks social distancing etc. The injections will not stop as the virus continues to mutate. CDC states children 5-12 are less likely to become deathly ill from covid. 1 in 1 million children will die from covid. Hardly a reason to inject an MRNA gene therapy injection into young children. I suggest you read peer reviews on the effectiveness of the gene therapy developed and the damage it is doing to the unsuspecting population that failed biology in school. Japan, Demark are currently rejecting the gene therapy drugs in favor of alternative methods, Ivermectin HCQ etc. to treat covid patients with much greater success than the gene therapy injections. You will not mandate these experimental injections in our children. You will not harm our children with forced injections. Period. Just like you tried to gain police powers to enforce this madness, denied you were, then admitted you did. You cannot tell the truth. I'm afraid the misinformation being promoted is your group in my opinion. You are a public servant. This means you will answer to us, not the pharmaceutical companies or the fake science to pass off this dangerous gene therapy you call vaccines.

Subject: Urgent need for course change

External Email

Dear Health Board,

As an author of curriculum to prepare young people to flourish in adulthood, I was heartbroken by an article from a public school teacher on the devastating impact our health-related policies are having on children. I urge you to read this article with an open mind and thoughtfully consider an immediate course change toward mandates (current and proposed) that are destroying lives in the name of public health. The latest research from Johns Hopkins on the futility and damage from lockdown policies only confirms the need for policy reversal. Our children's futures are at stake, and we are all counting on you to do the right thing.

Here is the article for your review: <https://bariweiss.substack.com/p/im-a-public-school-teacher-the-kids>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fbariweiss.substack.com%2Fp%2Fim-a-public-school-teacher-the-kids&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Cf4e3cefb22194d41127f08d9e74b2419%7C11d0e217>>

Thank you for your consideration and service.

I am against adding the COVID vaccine to the k-12 requirements. It has been shown that the vaccine is more dangerous to kids than COVID is. To approve this would be beyond idiotic and the result will just be more kids leaving the public system.

I can only think the reason there won't be any public comment time during this meeting is because you all already know you'll receive an overwhelming response of those who will comment against this.

Subject: Covid meeting 1-12-22

External Email

January 15, 2021

Dear,

Kaitlyn Donahoe

This letter is regarding the Washington State Health Department meeting on January 12, 2022 to make proposed changes to allow local health officers to use law enforcement (WAC-246-100-070) to force an emergency order to involuntarily detain a person or group of persons (families) to be isolated in a quarantine facility (WAC 246 100 045) following refusal to voluntarily comply requests for medical examination, testing, treatment, counseling, vaccination (WAC246-100-040). These specifics come from WAC 246-100. This includes the Covid-19 injections as part of school immunization requirements using WAC 246-105.

This ruling, which is not a law, but a ruling will force people to containment camps who are not vaccinated. Using the false assumption that the vaccines are only the solution to end the covid 19 and the variants is grossly negligent. There is overwhelming evidence and data showing there are many alternative therapeutics and treatment solutions for Covid-19. Such as and not limited to, vitamin c, d and zinc, black seed cumin treated early has significant positive results. Ivermectin and Hydroxychloroquine were being used at the very start of the Covid -19 pandemic with great success and continue to be used. They have no long term side effects and have been used for decades and are very inexpensive to produce and readily available. We have witnessed these two drugs save two seniors from dying from the covid 19 virus and many individuals that have used these therapeutics and treatment solutions and were cured of Covid-19.

As an elected or public official, your first obligation is to no harm, known as common law 1st, do no harm its constitutional duty. We are all equal no one is above the law, no one lives above the law. You are causing harm. Rule of law which clearly states that the government as well as private actors are accountable under the law.

I have researched by listing and reading from many Medical and Senior Law experts, which they state no one knows the long-term effects of these Covid 19 vaccines.

What I have seen on the VAERS report dated back in Aug 8th, 2021, 571,830 total reports of adverse effects, only between 1-10% of adverse events are reported in VAERS by some estimations.

Deaths 12,791, Life-threatening 13,140, permanently disabled 16,044, Hospitalizations: 51,242 Anaphylaxis 5,282 bell's palsy 4,461, miscarriages 1,505 heart attacks: 5,590 severe allergies 24,3050.

According to WHO, World Health Organization, the Vigil Access was launched by the World Health Organization in 2015 to provide public access to information in VigiBase. This is the WHO global database of reported potential side effects of medicinal products.

I have listed a few and these are the total adverse reactions:

Mumps vaccine: 713 from years 1972-2021

Hepatitis B vaccine: 104,827 from years 1984-2021

Pneumococcal vaccine: 236,307 from years 1980-2021

Influenza vaccine: 272,438 from years 1968-2021

Covid 19: 2,513,185 from ONE YEAR 2020-2021

This is illegal unlawful and unmoral. You are causing harm.

Respectively,

Howard & Tracy Moreland

Orting, Washington

Hello, I have concerns already for the overly legalized list of vaccines mandated. We do not need to add another. Especially not to add a vaccine not having gone through and verified for safety. This would relate to Agenda Item #9

For Agenda Item #11, To prohibit change of 246-105 WAC, Must be prohibited from adding any health treatment that is not thoroughly tested past Phase III safety trials. Safety being not maiming or death, early onset or future.

I am an educator.
We don't require flu shots, why would we require Covid shots! Not a question.

My 5 th grade students asked me during a science unit about how if we breathe out CO2, how can it be good to wear a mask and breathe it in all day long....out of the mouth of babes.

This control grab needs to stop. Use your heads and stop believing the garbage you read. Stop being lazy, do your own research and stop letting people sucker money from the state.

Coronavirus has been around for centuries, it is not containable, 2 years in and you haven't figured that out??!! This virus moves through animals, but even as I print it is continuing to slow down and become less and less severe (as virus's do). Offer a yearly vaccine, such as we do with the flu. But mandate one, NO!!

We need to remain America, and continue to have and respect freedoms.
Stop making billionaires out of our pharmaceutical companies and CEOs

Please do not mandate the covid "vaccine". That would be my final straw and I would remove my kids from public education and seriously look at moving out of this state. No one on this board, or in this state, or government leader, can ensure the safety of this shot. NO ONE. It can't be done. There is no safety data. It hasn't been out long enough. And if you're doing any critical thinking at all, or research, or paying any attention to what is going on around the world, you will see that athletes are collapsing on fields and gyms in record numbers... This has never happened before. We watched as a 20 year old BYU basketball player went numb on the court, during a game, and was taken off the court. He now has myocarditis and will never play basketball again. 20 years old. 100% healthy before receiving the shots. My son is a college basketball player and we pray every day for his and his teammates continued health and safety. My sons best friend, 20 years old, just had an emergency surgery to remove a blood clot, before it made it's way to his lungs, which would have probably killed him. Just a few months after receiving his shot. My friend's 27 year old wife had a stroke right before Christmas, with in a few weeks of receiving her booster. And I could go on and on and on. There is a facebook posts with HUNDREDS OF THOUSANDS of comments about adverse reactions and death, people have experienced since getting their shots. Until Pfizer releases ALL of the safety data it is absolutely abhorrent that we are even having a conversation about adding this shot as a requirement to going to public school.

Anyone who wants the shot can get it. YOU want it? Get it. A teacher wants it? They can get it. A student wants it? They can get it. No one is saying they can't. But it absolutely should not be mandated. If my child is forced to get it and has an adverse reaction, you can bet I will be coming after every agency, the department of health, the school board, OSPI for forcing it. The drug companies are not liable. That means you are. If you mandate it you are accepting liability. You will be in violation of the Nuremburg codes, as you can not get informed consent, because no one knows what the side effects actually are. They won't tell us.

The right answer is no. PERIOD. The shot is available for anyone that wants it. That is enough. Have some morals and ethics and stand up and do the right thing. For us, our children, our grandchildren, you're children and grandchildren. Be better than a political pawn in our power hungry tyrant of a governor's game that he refuses to quit playing. We all can see it doesn't stop the spread or transmission of covid. And children have a .0000018 chance of dying from covid. So WHY??? WHY would you ever even consider making it mandatory? The risk of myocarditis becomes 1 in 6 for a male under 40, after being given this shot. Yet that same male has a 99.98% chance of surviving. It just doesn't make any sense. None of it makes sense. And it's time people that have the ability to exercise common sense and make the right choices do. For all of us little people that do not have a voice. YOU are our voices. We need you to hear us and act in our best interests. PLEASE!!!!

Subject: Covid Tech Advisory Feedback

Hello

Re: "COVID-19 Immunization Technical Advisory Group/Feedback Requested
The State Board of Health has coordinated with the state Department of Health (DOH) to convene a technical advisory group (TAG) to evaluate the COVID-19 vaccine against the Board's immunization criteria and then make a recommendation on whether to add the vaccine to the state's list of required immunizations for school entry. The WA State Board of Health is currently gathering feedback on potential inclusion"

Will there be public meetings on the above? Or where can one submit feedback?
My daughter is in elementary school at Seattle Public Schools

Thanks
Eric Dillin

To whom it may concern:

It's been a VERY long time since us parents have gotten any communications from our district and state leaders regarding when masking for our students is going to be over. This has gone on entirely too long. Isn't it time masks should be an option for students and staff? I feel no one is advocating for us who wish to move on from this endemic. The staff and students who are vaccinated and want to continue to wear maske are advocated for but we are left frustrated and ignored.

We are one of the last states to have these mandates! Why is this "emergency" lingering for 2 years?! It's time to speak up and update us families on when this is projected to stop. It's been crickets this entire school year.

Frustrated parent,
Katie

Hello,

I am writing to you to STRONGLY encourage you to vote NO on the vaccine mandate for school age children. You know that the majority of parents are against this and many, many more children will be leaving the already failing government school system if you do this.

Also, there is zero proof that this inoculation does anything other than cause potential harm to kids. Not sure how you all sleep at night knowing this is a huge money grab by the pharmaceutical companies and does nothing for public health.

Thank you,

1. Yes

The Covid vaccine requirement discussion of the advisory group

11.

Are you Pro or Con on the proposal?

2. Con

I do not believe with the amount of infections and the cdc stating it's 6x-24x the actual number of cases reported that we shouldn't look at natural immunity as part of this. We also need the next 5-8 years of data accumulated as parents to feel comfortable with long term affects. We do not require a flu vaccine, we have sent our kids to school regardless of the pandemic and the shots are available to who wants them, this should not be recommended at this time not required, the data on severity doesn't back this at all. The people at risk we know are not this age group unless obese, kidney, diabetic, heart issues. They will get vaccinated. We know being vaccinated doesn't stop cases, infections nor stop giving it to someone. Hold off for the data on these vaccines before requiring it. I am vaccinated so I can be protected but I do not want my children to be required with it at this time and they have had it and have antibodies.

Subject: Covid-19 vaccination mandate

External Email

I received a link to complete a survey for COVID-19 vaccination immunization for children. I spent over 10 minutes writing out thoughtful responses only to see that "the maximum number of responses have already been received...". Why send out a survey if you're only looking for the first 100 (or 1000) responses? (Survey is supposed to be open for another few days).

I support medical professionals' opinions. If doctors and scientists recommend children get vaccinated, I support their decision. We don't get layman opinions regarding other immunization requirements; why ask what uneducated people think when it comes to the health and safety of our children? My kids are vaccinated because I believe it's the responsible thing to do. As someone not in the medical field, I wouldn't force others to do something I'm uneducated about. But if doctors believe it's imperative to public safety, I would support a mandate/requirement- just as I do for other immunizations.

Thank you,

Subject: January 12th, 2022 zoom meeting

External Email

The original email was sent 01/12/2022. It did not arrive at its destination. Here is option #2.

Good morning and happy Wednesday.

Thank you for providing the opportunity for public input today. I only became aware of this last Friday evening. By then It was too late for public comments. I saw no public announcements except the internet rumor mill Friday evening. The only public announcements came Monday.

Perhaps better public communication by all possible means (television, radio, internet) would help.

Thank you too for the clarification of the meeting agenda, specifically what it does not include, i.e. proposed changes to WAC 246-100-070.

With that said I have chosen to leave the meeting.

I would appreciate clarification of what power the current WAC 246-100-070 actually can impose on the public concerning immunizations, exemptions and failure to comply.

As a retired 43-year veteran of public education who taught immunology (how the immune system works), the value and history of vaccines, and the benefits of natural acquired immunity in my human anatomy and physiology classes as well as being a high school football and wrestling coach all my required immunizations are up to date.

The exception is what the N.I.H. calls the experimental mRNA and DNA Adenovirus protocols produced by Pfizer, Moderna, Astrazeneca and J&J.

My issue follows on the history of the Nuremberg Trials, resulting in the 1947 Nuremberg codes.

U.S. law embraced the Nuremberg Codes with two laws:

1. 21 cfr 50.23 & 24. It is illegal to make anyone participate in an experimental program using coercion.
2. 18 cfr Section 2331 Subsection 802. Anytime a U.S. citizen is forced to do something they would not otherwise do is coercion and domestic terrorism.

To be sure, reading the text of these two laws is laborious in distilling the details into simplicity.

Two final questions:

1. If these two federal laws are accurate does the current WAC 246-100-070 stand in violation?

2. If the aforementioned laws are accurate is the Washington State Board of Health willing to be in violation? Are there exemptions? If so please explain.

Lastly, the FDA requires by law Package Inserts to be enclosed with every dispensed drug. The purpose of these P.Is is to inform the recipient of all the controlled experiments showing the efficacy of the drug, but more importantly the potential adverse effects.

The recipient now has the information necessary to give informed consent. I wonder how many ask to see the the P.I. before getting injected with these protocols.

Watch any televised drug commercial. In fine print and fast talking person these potential adverse effects are mentioned.

If I ever choose to step out of the Control group of this worldwide experiment and potentially partake in the "jab" protocols I will demand to see and read the P.I. Only when I have the evidence of the efficacy and adverse effects required in the P.I. will I be better equipped to give my informed consent. It will be my choice not coercion.

I have a lot more to say. I apologize for this not being a Laconic statement. As a former teacher and athletic coach I choose to leave no stone uncovered when committing to excellence.

Respectfully,

Doug Cowan

Subject: Covid Vaccine Requirement

External Email

To whom it may concern,
I am a mother of two children - 6 and 8 years old. I understand there is a meeting (zoom for the public) on Thursday, February 10th from 9am-3pm to discuss the possibility of making the covid-19 vaccine required for students k-12. Since public comment is not allowed during this meeting, I decided to email the board members. My children are healthy. They have been exposed to covid from my husband and I twice since last April. They ever showed symptoms, never tested positive, they thrived. Their bodies fought anything that came their way which is why I am **STRONGLY ENCOURAGING** you all to please consider **NOT** making the covid-19 vaccine a requirement. Children have been exposed to this and are not affected by this whatsoever. Why would we inject our children with something that is still in the experimental process when they don't need it? I am not against vaccines. My children have had all the vaccines I had when I was a child. My children no longer get the flu shot. Their immune systems are so strong and build every day. From getting natural immunity from my husband and I, their immune systems are 10x stronger than another child who receives the vaccine. There is **ZERO** science behind this vaccine. Social Media and the MSM are pushing this in so many ways and rewarding people who receive it. Does that not raise red flags? Everything about this **SCREAMS CONTROL**. My husband and I refuse to vaccinate ourselves because we have had it. People call us "conspiracy theorist" but everything we have said in the past is now becoming the truth.

We will not allow our children to get vaccinated just to attend public school. That is unconstitutional, we have our god given rights, and it is coercion.

Please **PLEASE** do not make this a requirement to attend public school. My children love going to school. They love seeing their friends and making memories. Please don't take that away from them.

Thank you for taking time out of your day to read my email.

Sincerely,
Heather Feroy
Federal Way Public School District

External Email

Dear State Board of Health,

How you the governing body over Washington State Policy can continue to ignore Natural Immunity, Damage to children from masking and public meeting where you pretend a WAC language has never been used in Washington pretty outrageous.

Dr Bob Lutz did use such involuntary quarantine tactics and then you unanimously hired him to the State Board shortly after his firing from the Spokane Board of Health.

Authoritarianism originates with petty bureaucrats and power hungry elected officials like Jay Inslee abusing their emergency powers to destroy small businesses and freedom of the residents of Washington State.

Why did you not stand up and follow the actual science such as cloth masks have and always will be a face decoration and nothing more. You all knew this and still let us be one of a few states with a mask mandate.

Only truly stupid people or those who crave power over others put in place and or support fake science and policy to satisfy their own inflated egos.

Next you Doctor's will be telling people leeches and blood letting are scientific cures. I ask you to find your integrity and go back to your oath of doing no harm. The opposite of what you have been doing the past two years.

There will be studies for years to quantify the damage done to our children. The OSPI of Washington is not a regulatory agency and neither is WSSDA and threatening school district for violating bad policy that everyone points to you and will be remembered.

You could have stood up to Jay Inslee and not threatened Doctors medical licenses or damaged people with erroneous policy and instead you remained silent and did nothing or worse took away medical licenses of Doctors who actually followed their oath.

Stop lying to the public as I have friends who are former military doctors and they have been prescribing Ivermectin since 1997.

People like yourselves have damaged the credibility of the medical profession in a way that will take the rest of my life to recover if it ever does.

Just like Fauci during the Aids crisis he pursued a monolithic plan of an Aids Vaccine and not therapeutics which became the answer. He discounted and subverted research and people died just like they did during Covid. You and others like you are complicit in these deaths.

Sincerely,

Tim Caldwell

Respectfully, Sir/Madam,

I'm writing to let you know that I am uniting with many people in Washington State to stand against the tyranny we are facing.

This letter is regarding the WSBOH meeting scheduled for Jan. 12, 2022.

According to information I have seen on the web in recent days, it appears that WSBOH will be discussing proposed policies that pertain to -WAC 246-100-070, WAC-246-100-045, and WAC 246-105.

You do not have our permission.

You need our permission.

Our kids are not your property.

Our bodies are a temple of the Holy Spirit and is not owned by the government

We are born with free will and we will retain that until death.

Thank you,

Sharlene A. Greene

The following survey response is submitted:

1.

Please select one:

Comment on the web

2.

Please enter your comments or questions in the space provided below:

Will the Department of Health open another survey for the community members to give their opinions about requiring COVID-19 vaccination for school age children? The threshold setup on the survey needs to be increased so more community member opinions can be entered. If that is not an option, please accept the follow as community feedback with regard to requiring Covid-19 vaccinations for school-aged children. I, Kim Ah Choy, a US Citizen living in Washington State for the past 41 years, strongly support a requirement that all school-aged children receive the full Covid-19 vaccination series prior to entry into any public school within the State of Washington. It is a matter of public health and safety. Mahalo Nui Loa (Thank you very much), Kim Ah Choy

Dear Covid Vaccine TAG,
I am writing to use as a concerned citizen, parent and grandparent of Washington. Please do not require the Covid vaccine for students in Washington. They are a very low risk group and there is no data on the long term affects of this biological agent. Protect the health of our children and wait for further research to be done before you require it.
Sincerely,
Angela, Shoreline

I am emailing you in reference to the voting that is taking place today on the Covid 19 mandate for children to enter schools.

I strongly oppose this mandate. I will be home schooling if this takes place in our state- which will pull me away from my full-time Clinical Practice.

The risk for children is low for Covid-19 but the risk they are taking with the vaccination runs high (we now know there is a high risk of myocarditis).

If teachers feel unsafe they should mask and vaccinate.

Please consider all facts before voting today.

Thank you for your time.

Hello Board Members,

I understand that you will soon be meeting to discuss covid vaccines for kids in school settings. I respectfully ask that this not become a part of the regular vaccine schedule requirements for school age children, and that it will stay optional. There are no studies available that show the vaccine effectiveness in the K-12 setting nor does covid pose a deadly risk to 99.9%+ of children. Adding a vaccine requirement for something that is statistically not a threat to children is unnecessary. Please give us all the freedom of choice.

Thank you for your time.

The following survey response is submitted:

1.

Please select one:

Other

2.

Please enter your comments or questions in the space provided below:

As a teacher in Washington, I am hoping that the Department's decision on vaccine mandates for students will be based on health and not on political motivations. I am a special education teacher and many of my students are medically fragile and extremely susceptible to illnesses. Masks and social distancing have helped to keep transmission low, thankfully. I worry that the decisions to require vaccines and to do away with masks will be politically motivated and not based on the health of ALL students and staff--especially due to the fact that a survey was sent to Washington parents and not to school staff.

Dear Washington State Board of Health,

Our state government should NOT be mandating Covid vaccines on our children. Children are at extremely low risk for Covid and these medical decisions should be left in the hands of parents.

Sincerely,

The Citizens of Washington State

To Whom it May concern,
I would like to know if this is a vote that the community will be able to have a say? I don't see any option for public comment for this meeting like the last one. Please advise.
Thanks
Nicole Bishopp

Subject: K-12 grades- Please Mandate Covid vaccination

External Email

Good evening,
We are hoping that a mandate will be implemented for Covid vaccination for K-12 grades.
Masks and vaccinations will hopefully help get our kids back to In-person in the Fall of 2022.
The vaccinated should be in schools and those that do not wish to vaccinate can zoom.
We have been patiently waiting.
Just like chicken pox, MMR , and other vaccines required to attend school, the Covid vaccine should be of utmost importance.
Thank you for your time,
The Leonard family

Final.pdf*

External Email

Dear Members of the BoH, DoH, Secretary of Health Shah and the Office of the Secretary of Health,

I am following up on two emails that I sent and have not received read receipts on.

In order to ensure that the emails and their attachments are confirmed as received, I am sending my email in a PDF format, just in case the size and format of the email has been flagged by email software as suspicious.

Very Respectfully,

Xavier A. Figueroa, Ph.D.

Keith Grellner, R.S., Chair
Dr. Thomas Pendergrass, Vice Chair
Elisabeth L. Crawford, Mukilteo Council Woman
Temple Lentz, M.S., Clark County Council Woman
Vazaskia Crockrell, M.B.A candidate
Fran Besserman, B.A.
Bob Lutz, MD, MPH
Umair Shah, M.D., M.P.H. and designee of Secretary Shah, Tao Sheng Kwan-Gett, M.D., M.P.H.

Members of the Washington State Board of Health, Department of Health and the Office of the Secretary of Health,

I write to you today on the issue of COVID19 inoculations, mask mandates, and the use of lockdowns. You are all officers on the board of health for Washington State and two of you are elected officials in council member positions. Four of you have advanced medical and scientific training. All of you are failing in your designated duty to protect the health and safety of the citizens of Washington State and in upholding the rule of law.

The recent denial of ICWA's petitions on January 12th, 2022, that was meant to remind the Board of Health (BoH) that federal and state laws are required to be upheld, was summarily dismissed on the grounds that, to quote Dr. Pendergrass, "I do not want to be in the setting where I am preventing some future event from occurring." It is concerning that members of the board agreed and voted to allow future boards to potentially violate state, federal and international law. As the board should be aware, all the COVID19 inoculations are still under E.U.A. and the provisions under 21 CFR section 360bbb3(a) are still in effect. It is impossible to provide informed consent if you do not have the necessary data to provide to physicians and recipients of medical products, as the clinical trial are ongoing.

A concerning aspect of the BoH's position on the COVID19 inoculations for children and the technical advisory group (TAG) convening is that the TAG should never have been formed in the first place. The BoH holds that the TAG was convened to review all the data on the COVID19 inoculations, but that cannot be possible. SARS-CoV-2, for our younger population, does not demonstrate a significant morbidity or mortality risk compared to pneumonia and influenza (P&I; Figure 1). The current totality of scientific evidence already demonstrates a far greater threat to the health and safety to our children from these experimental therapies (Pfizer/BioNTech, Moderna and Janssen) than the SARS-CoV-2 virus ever did (Figure 2). What is apparent is the bias displayed by the Washington State DoH in presenting data to the BoH and overreliance on the Western States Scientific Safety Review Workgroup. This does not relieve the BoH of its responsibility to demand a complete review of the existing data. If the Washington State BoH was solely reliant on the Western States Scientific Safety Review Workgroup recommendations, the BoH has left gaping holes in its review of the totality of scientific, epidemiological, safety and medical data that it needed to analyze.

I am sure that I do not need to remind the BoH that all PCR/NAAT and antigen tests are in the market under an emergency use authorization (E.U.A.). They are not cleared to diagnose or even have a guarantee of being accurate or reliable. Medical and technical publications on the reliability of the PCR/NAAT tests show a wide range of false positivity

(<https://www.ncbi.nlm.nih.gov/pmc/articles/PMC7934325/>; BMJ 2020;369:m1808 doi:

10.1136/bmj.m1808; <https://www.jwatch.org/na52823/2020/11/30/accuracy-rapid-sars-cov-2-antibody-test-kits-limited>), as well as the need of verifying the ability to culture virus in order to guarantee that PCR tests have a modicum of reliability at Ct values above 30 cycle times (<https://academic.oup.com/cid/article/72/11/e921/5912603>). The indicated articles are just a sampling of what has been published.

The reliability of the 6 month results from the Pfizer clinical trial as an indicator of the outcomes of the general population have been questioned (<https://blogs.bmj.com/bmj/2021/08/23/does-the-fda-think-these-data-justify-the-first-full-approval-of-a-covid-19-vaccine/>) and the post-authorization (note: this is not a post-marketing surveillance report) review by Pfizer itself shows a higher than expected morbidity and mortality (**5.3.6 CUMULATIVE ANALYSIS OF POST-AUTHORIZATION ADVERSE EVENT REPORTS OF PF-07302048 (BNT162B2) RECEIVED THROUGH 28-FEB-2021**; <https://phmppt.org/wp-content/uploads/2021/11/5.3.6-postmarketing-experience.pdf>): 1,223 deaths out of 42,086 patients (a 2.9% risk of death). This is unprecedented and concerning that the BoH has not addressed or acknowledged the Pfizer report and event. I am unaware that the Western States Scientific Safety Review Workgroup has even commented or reviewed this information.

The totality of evidence in the United States of America is indicating that there is a tightly linked correlation between COVID19 administration and reports to the VAERS system (Figure 2). Until coroners and local pathologist begin the critical autopsy work on these patients, we have to rely on these systems to make health policy choices. So far, the roll out of the COVID19 inoculations are indicating a higher rate of AEs, SAEs (stroke and myocarditis) and death than historical averages for all recent vaccine reports (Figure 3). Even comparing all VAERS deaths from 1990 up to 2021, the totality of deaths is orders of magnitude higher than the closest comparable year (2018-2019) and exceeds six-sigma deviations (Figure 4). I have not seen a single statement by the BoH and the Western States Scientific Safety Review Workgroup comment or review any of the data presented here in this letter.

The reports submitted to VAERS are supported by over 1022 peer-reviewed medical article (see references) that align with the list of expected side effects that were disclosed at the FDA Vaccines and Related Biological Products Advisory Committee – 10/22/2020; (<https://m.youtube.com/watch?v=1XTiL9rUpkg>). The potential side effects are listed:

1. Guillain-Barré syndrome
2. Acute disseminated encephalomyelitis
3. Transverse myelitis
4. Encephalitis/encephalomyelitis/meningoencephalitis/meningitis/encephalopathy
5. Convulsions/seizures
6. Stroke
7. Narcolepsy and cataplexy
8. Anaphylaxis
9. Acute myocardial infraction
10. Myocarditis/pericarditis
11. Autoimmune disease
12. Death
13. Pregnancy and birth outcomes
14. Other acute demyelinating diseases
15. Thrombocytopenia

16. Disseminated intravascular coagulation
17. Venous thromboembolism
18. Arthritis and arthralgia/joint pain
19. Kawasaki disease
20. Multisystem Inflammatory Disease in Children
21. Vaccine enhanced disease

Thrombocytopenia/ Thrombosis	Stroke	Ischemia/ischemic	Myocarditis	Pericarditis	Guillain-Barre	Myelitis	Adenopathy	Cancer	Bell's Palsy	Encephalomyelitis
306	12	12	212	60	15	18	52	10	26	1

The table above highlights the most common reported post-vaccine associated side effects that are in the attached list of Articles/Reports. The articles were collated and prepared by the Save us Now network (<https://www.saveusnow.org.uk/covid-vaccine-scientific-proof-lethal/>), but I was able to confirm that all are peer-reviewed articles or related to the post-vaccine effects or programs/policy to reduce vaccine hesitancy.

This should be more than sufficient to cause a moment of pause by the members of the BoH and to re-assess the appropriateness of continuing with the current path.

As part of my writing to you, I have a few questions that I would like answered by Secretary Shah, his designee or the members of the DoH and the BoH.

1. When the COVID19 vaccination program began in Washington State, where any members of the Secretary of Health's office, the Washington State DoH or the BoH provided with the list of potential side effects that were presented to the Vaccines and Related Biological Products Advisory Committee? Did the Western States Scientific Safety Review Workgroup review the data available or the known and unlisted components of the COVID19 inoculations?
2. If a potential list of side effects was not provided, what steps (if any) did the Secretary of Health's office, the Washington State DoH or the BoH take to acquire a list of potential side effects and the ingredients in the injections? Was there a request sent to the Western States Scientific Safety Review Workgroup to provide you with such information?
3. What steps (if any) did the Secretary of Health's office, the Washington State DoH or the BoH take to ensure that physicians, clinicians, nurses, pharmacists, and other health care professionals could provide informed consent to individuals receiving these COVID19 inoculations?
4. Where there any discussions or meetings held by the Secretary of Health's office, the Washington State DoH or the BoH to establish a stopping condition for the COVID19 inoculation program?

5. Where there any attempts or recommendations by any members of the Secretary of Health's office, the Washington State DoH or the BoH to request or review deaths or serious adverse events that may have been linked to any of the COVID19 inoculations in Washington State?
6. Have any members of the Secretary of Health's office, the Washington State DoH or the BoH attempted to collect or review autopsy or pathology data on adults or children reported to have died following or be suspected of dying from one of the COVID19 inoculations?
7. The Western States Scientific Safety Review Workgroup announced on May12, September 24, October 22, November 19 of 2021 and January 5, 2022 that they had reviewed the data from the Pfizer, Moderna and Janssen clinical trial and were continuing to recommend COVID19 inoculations from Pfizer, Moderna and Janssen, as well as the boosters. Has the Western States Scientific Safety Review Workgroup commented on or analyzed the Pfizer CUMULATIVE ANALYSIS OF POST-AUTHORIZATION ADVERSE EVENT REPORTS OF PF-07302048 (BNT162B2) RECEIVED THROUGH 28-FEB-2021? Has the Secretary of Health's office, the Washington State DoH or the BoH reviewed the same?

I am sure that I will have more questions as time and information from public and private sources become available. I look forward to receiving your information and learning more about the process and decision making used by the various offices and departments. I hope that this dialogue will help to support the health and safety for all Washingtonians.

Very Respectfully,

Xavier A. Figueroa, Ph.D.

Dear Technical Advisory Group,
I would like you to consider the fact that including a Covid-19 shot for K-12 school children is not a wise thing to do.
There is no published research at this time that shows it is effective in this age group. Just released last week, a large study by John Hopkins compiled over the past two years has shown that lockdowns, masks and vaccines has had little to no effect of stopping the Covid-19 virus.
Deaths in children of this age from Covid are very few in comparison to others on the list. In fact, because of the isolation, etc. suicide is the 3rd leading cause of death for teenagers ages 15-19.
Then consider the side effects from this vaccine, and it is all the more reason why I would never have my child vaccinated. I would hate to find out my child was one of the ones that died or had permanent bad effects for a lifetime.
Please vote NO on requiring this vaccine. That is a parent's decision.
Thank you.
Amy Galbreath

8th February, 2022

**State Board of Health Washington
Olympia, WA, 98504**

Dear State Board of Health,

I am writing to you on behalf of all the children in Washington State. This is in regards to the issue of mandating children to be inoculated with the Covid19 gene therapy (vaccine). First of all can you please provide a copy of the ingredients that are in the children's vaccine that you are preparing to mandate? Then can you provide a copy of the testing done that proves the gene therapy is safe and effective?

All the studies done on animals with the Covid 19 gene therapy show the animals died. So, don't tell me you are going to just use the children as test subjects? You all are the Public Health Officers and one would hope you took an Oath to keep people safe from harm. The numbers are staggering on the injuries and deaths from the Covid 19 gene therapy for adults yet, you are willing to just go ahead and push for the children to receive the deadly toxins. How can you people justify this in your conscience? How many children need to be harmed or dead before you stop the push on this stuff.

The psychological damage alone from the masks, lock downs and school closure is heartbreaking. How can you justify putting the children's life at risk to save face? I am bewildered that you would just look the other way and not do the right thing which is to stop this madness. I am a mother, grandmother, nurse educator, and a wife plus I have been in health care for over 35 years and this is absolutely heartbreaking to think you would consider such a thing. If the scenario was different and the (vaccine) gene therapy had passed a rigorous testing and studies proved it was safe then I would agree. This is not

the case whatsoever and children are being harmed and only GOD knows what the true numbers are on vaccine injuries. One would think if this virus was that deadly, then we would be picking people up off the floor, the streets, and find them lying all over the place. This is just not the case and the children are at lower risk of catching it or spreading it.

I plead with you to reconsider this before it is too late and you cannot take it back. My heart just drops to the very pit of my soul when I think about the harm you people are about to instill on the children.

Sincerely,

Jodi Dotson

As you are preparing to answer the questions before you as the BOH TAG regarding COVID "shots" for school children I implore you to Please, Please, Please study the document sent to you by Informed Choice WA responding to all 9 criteria. These "shots" fail the test of all 9 of the criteria.

"It's clear that Pfizer - and the agencies overseeing their trials - failed to follow established, high quality safety and efficacy protocols right from the beginning. . . Any government that approved this medical intervention for its citizens should have ensured that the trial had used the appropriate clinical endpoints and high quality safety science. .

..... Any government official who possesses this evidence and continues to allow its citizens to be inoculated with a toxic agent is, at the very least, negligent.....

Adding these shots to the child vaccine regimen flies in the face of science, medical freedom, informed consent, parental rights, and several well know health and experiment doctrines, ie; Barrington, Nuremberg et al.

This is not science. This is not safety. This is not in the best interest of vaccine recipients. This is using Americans, especially our children who are most impacted, as unwitting test subjects. This is human experimentation without informed consent. This is removing the parents from making the healthcare decisions for their children.

Remember your own criteria.....

BOARD CRITERIA FRAMEWORK:

The only purpose for which power can rightfully be exercised over any member of a civilized community, against his will, is to prevent harm to others. His own good, either physical or moral, is not a sufficient warrant."

Harm to others cannot be prevented by requiring children attending school to take this vaccine.

In closing:

I challenge your group to make the right decision.

I challenge you to step up to the plate and do something that will positively impact the children in our state for the remainder of their lives.

Your decisions will ultimately impact the rest of our nation's children and possibly children around the world.

Dare to be a hero for all, do not allow these shots to be included in the child vaccine regimen.

Hello Washington State Board of Health,

I am writing to request that the Covid-19 Vaccination not be requirement for children to go to school in Washington State. What you are requiring is against the constitution and against science. This is being pushed against people's will. The Covid-19 vaccine is not a true vaccine and it has caused many injuries in young people and killed many. This is still being pushed for your own benefit!!!! The blood will be on your hands if you continue participating in this evil.

Vaccines for kids

There is no published literature on pediatric Corona virus vaccine effectiveness in the K-12 school setting. Suicide is the NUMBER 3 killer of children in the 15-19 age range for Washington state. Corona virus vaccines for children should not be our priority unless and until proven data is published to justify making it so.

Dear WA State Board of Health members:

I am writing to express my opposition for adding the COVID-19 injection to your vaccination schedule for school admission, or for any other such rule or mandate.

The COVID-19 injection is not a "vaccine". By its very name — a "vaccine" it does not fit within the parameters of your vaccine schedule.

The COVID-19 injection is an Emergency Use Authorized, experimental drug. It does not stop transmission — one shot, two shots, or boosters. COVID-19 is just like the regular flu, and it's going to be in our midst — variants and all, just like different strains of the seasonal flu.

Has a flu shot ever stopped the flu? No, it has not.

Under these circumstances, a COVID -19 shot should not even be considered for the school schedule of vaccinations. To do so is an overreach of your authority.

Below is a link that the entire Board of Health must review. It is a legal summary before a Grand Jury of a worldwide indictment against the COVID-19 pandemic. This summation was presented on 2/5/2022, and legal proceedings will be underway this very week.

This is not a long video. It is excellent. Please view this — your entire Board, and put this information in your "thinking caps".

Thank you
Marsha Stockdill

To Whom It May Concern:

I wish to be heard regarding the board's upcoming determination as to whether or not to include the COVID-19 vaccination to a list of required childhood immunizations. I implore you to carefully consider the safety data of this vaccine as it relates to usage in children. In my view, when weighed against the CDC death rates due to COVID-19 regarding children 0-18 years of age, in light of Director Walensky's relatively recent admission that individuals who have succumbed to COVID-19 had an average of four comorbidities, the reported side effects from this vaccination when administered to otherwise healthy children is simply not worth the risk of administration. This is simply about risk assessment and, frankly the medical community, public health, and governmental authorities have failed the public repeatedly in this regard throughout this pandemic. From the beginning, the primary focus should have been on the vulnerable. Fortunately, within the context of this virus, children are generally not that vulnerable to death. There is a rather large contingent of the public who do not consider administration of this vaccine to children as acceptable. It's my personal prediction that if the board decides that the COVID-19 vaccine is to be added to the required immunizations list the result will be that many parents will withdraw their children from public education. The fallout will be truly catastrophic. To proceed in this direction would be truly wrongheaded.

Thank you for your thoughtful consideration.

Dear Ms. Kahler,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

Subject: WSBOH survey corruption, possible negligence in policy-making, and applicable law.

External Email

Concerned parties:

A week ago, the The Washington State Board of Health's Technical Advisory Group (TAG) was gathering public opinion for use in decision and policy-making via an online survey regarding the creation of policy requiring Covid-19 Vaccination for children in schools at the URL:

Microsoft Forms

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fforms.office.com%2FPages%2FReLQEU4mCkCLoFfcwSfXLeFTdB7APrJAvkZ64U-RFNVUQTIGRFVMOFM1MEVNVU1Ktk9DN085REhZNy4u&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Cb5>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fforms.office.com%2FPages%2FReLQEU4mCkCLoFfcwSfXLeFTdB7APrJAvkZ64U-RFNVUQTIGRFVMOFM1MEVNVU1Ktk9DN085REhZNy4u&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Cb5>

Microsoft Forms

It has sine been taken down as it expired per their own terms.

The survey is flawed in that there was no identification required of survey participant (anyone [or bot] could say they live in Washington), but more importantly, there was no restriction to HOW MANY TIMES the survey could be taken by the same IP address (person, or bot). Hypothetically, an internet bot could have registered any amount of responses, corrupting the data. Individuals from private interest groups could answer multiple times (to an unknown maximum of survey entries).

We were alerted to this flaw on Twitter and confirmed our device could supply answers and submit to the data pool more than two times.

There has been no indication or statement from the WSBOH on this flaw or corrupted data pool being used to decide policy on this volatile issue.

This implicates similar errors (and possibly intentional interference) may have already been part of the TAGs practice.

Actions should be taken immediately to make new gathering tools and retake an accurate survey that is not tampered with.

We are considering notifying news agencies, and searching applicable laws that protect

citizens from using corrupt data for decision and policy-making.

Subject: Comments for the Immunizations Technical Advisory Group

External Email

Dear Immunizations TAG members,

I would just like to say that I hope you folks have done due diligence on this subject. There is a lot of current information from the CDC, scientists, doctors, etc. with updated concerns for the Covid-19 shots. VAERS has a lot of reported side effects that are very concerning!! Please table this and DO NOT agree to add this shot to the list of required vaccines in WA state schools. This mRNA shot is still so controversial and WA state is so over the top still with the mandates the government is still requiring. Entire countries are discarding their mandates and we have so many states here in the US that are not mandating anything! But WA state is so bent on continuing this erroneous shot and all the mandates connected to it for some unexplainable reason. People are getting so fed up and I don't doubt that there will be an even larger exodus from the school systems of kids whose parents refuse to take the risk of their children's health, than what has already happened. Our children deserve so much better!

A vote to NOT recommend the Covid-19 shots for school age children in WA state would be appreciated.

Thank you,

Maggie Rody

Dear Miss Donahoe,

In the event that you "take Possible Action" regarding Chapter 246-105 WAC please know that I am absolutely NOT in favor of Covid vaccine requirements for children for school and daycare. This would definitely be overreaching and immoral. If you refuse to allow unvaccinated children to attend then give them their education dollars and they can go elsewhere.

I won't lie... the following item also has me very concerned. The thought that a local health officer has sole discretion to do something like this is incredible.

WAC 246-100-040

Procedures for isolation or quarantine.

(1) At his or her sole discretion, a local health officer may issue an emergency detention order causing a person or group of persons to be immediately detained for purposes of isolation or quarantine in accordance with subsection (3) of this section, or may petition the superior court ex parte for an order to take the person or group of persons into involuntary detention for purposes of isolation or quarantine in accordance with subsection (4) of this section, provided that he or she:

A local health officer may invoke the powers of police officers, sheriffs, constables, and all other officers and employees of any political subdivisions within the jurisdiction of the health department to enforce immediately orders given to effectuate the purposes of this section in accordance with the provisions of RCW 43.20.050

<<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fapp.leg.wa.gov%2FRCW%2Fdefault.aspx&cid=3a2f2fapp.leg.wa.gov%2FRCW%2Fdefault.aspx>>
(4) and 70.05.120

<<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fapp.leg.wa.gov%2FRCW%2Fdefault.aspx&cid=3a2f2fapp.leg.wa.gov%2FRCW%2Fdefault.aspx>>

.

Where are the rights of "We The People" when it comes to this sort of action. The fact that they only have to have a "reason to believe" is crazy.

I think it's pretty obvious that these items need to be changed in light of where we find ourselves today and the massive overreach of our existing government.

Sincerely,

Mary K Geiselman

We will NOT allow any of our family members to take any experimental drugs of which this drug is being called a "vaccine" for the virus that the Chinese government horrifically spread to the world two years ago. This "vaccine" is not a vaccine because it does prevent one from contracting the Chinese virus or spreading it. Moreover, children are the least likely to get sick from it or being vectors. We will homeschool and/or move from this state need be.

Dear Policy Advisor Donahoe, Washington State Board of Health Members, et.al.

I urge you to consider the real science and full spectrum of medical data when considering requiring a COVID vaccine for day care and school attendance. Randomized controlled trials are the gold standard in medical research because there is a control group.

Pfizer conducted a randomized control trial of 44,000 patients divided into two groups. One group gets the vaccine, one group gets a placebo. More people died in the Pfizer vaccine group than in the placebo group. The difference wasn't statistically significant but scientifically one cannot claim these vaccines reduce death.

A matter of fact was a double blind study that was done with only 4,000 adolescents, aged 12-15. A study this small will not show up risk. Of the inoculated group of 1,005, zero tested positive for C-19, while the placebo group of 978 had 18 who tested positive for C-19. The Pfizer group claimed great results. However, since adolescents are a statistically 0% risk of death from Covid-19, and a very low risk of severe illness, the inoculation is of little benefit to them. Instead, it presents a very real risk of adverse events.

The Pfizer study wasn't actually designed to find those. A serious Adverse Event, including death, that occurred at a 1/800 rate might not even show up in a sample of 1,005 people. But, in this case, it did. Among the 1,005 adolescents, there WAS at least one serious adverse event - the death of Maddie de Garay.

The Pfizer and Moderna vaccines use non-FDA-approved mRNA gene therapy, according to their filings with the US Securities and Exchange Commission. Clinical trials for the drugs conclude in 2023. The only FDA-approved version of the vaccine is Comirnaty, which is not currently available, and is different than the emergency use authorized Pfizer-BioNTech vaccine. 21 US Code 360BBB protects one's right to refuse any emergency use authorized medical products, therefore it is illegal to mandate an EUA vaccine.

The VAERS database is the database for vaccine injuries. A Harvard report in 2010 shows that fewer than 1% of vaccine adverse events are reported to VAERS. The CDC validates all entries and false allegations are prosecuted. Pre-COVID, VAERS shows about 158 deaths due to vaccines per year. In January 2021, over 17,000 deaths and over 70,000 hospitalizations from the Covid Vaccines were reported. This quantity of lethal reactions have historically shut down other vaccine programs.

Further, the CDC says that the Covid hospitalization risk for children is about the same risk of the flu.

Tens of thousands of doctors around the world, including the creator of the mRNA technology Dr. Robert Malone, warn of the extreme dangers of this experimental Covid drug. It is not safe, responsible, or legal to require this experimental drug for children.

Thank you for your time.

There is a push to have Nuremberg style tribunals over the deaths and crippling reactions to the C19 vax rollouts. I would advise listening to these experts convened together by Senator Ron Johnson of Wisconsin. Many of these individuals are world renowned experts in their fields. You want to consider vaccing children when the rise in myocarditis has been reported to be catastrophically high, especially in young males. The world will not forgive if you abuse your powers to cause harm.

Good Afternoon TAG,

Firstly, our children cannot be subject to an experimental vaccine that is still under the EAU. Furthermore, the FDA approved Comirnaty and Spikevax are not even available at this time in the US for any person.

Secondly, it typically takes 15 years for a vaccine to be approved. We don't know the long term effects of this vaccine, let alone the short term.

Thirdly, kids are not getting sick from covid, let alone dying from it.

Fourthly, those who have had it are inoculated, just like any other virus, such as chicken pox. What makes Covid any different other than a catalyst for a means to control and undermine people.

CHILDREN ARE NOT AT RISK! IT'S AN EXPERIMENTAL THERAPEUTIC THAT DOES NOT EVEN CREATE IMMUNITY!

Kindly,

Andrea

To whom it may concern ,
We need to have a discussion on natural immunity if my child has had Covid I see no reason for a vaccine that may or may not have an affect on my child. Namely heart or blood clot issues
Also it should be a choice if the child wants to wear a mask or not this is detrimental to the learning process and is has had major issue in children's physical and psychology. This group of children are not dying of Covid but may have it in conjunction with a myriad of differing co morbidities which results in death (rare)
I don't want to have to homeschool my children. Love our faculty and staff at our community school, I don't want to have to choose between this or homeschool so I'll caveat let's make it optional to get a vaccine or wear a mask. I believe in Free agency and I'm against any mandates of any kind.
Thank your for your time a very concerned parent.

Please, if you are seriously considering implementing the requirement for Covid vaccine, watch this video and think about the serious consequences you may be placing on young children. Also think about the culpability you will be placing on yourselves and the Washington State School systems if you require this vaccine and then in years to come have a rash of new cancer diagnoses for children, myocarditis, or other yet unknowns of this vaccine. You can have your own opinions on these Dr.s, but you have to be honest with yourselves that there is some truth to what they are saying. We DO NOT know what these vaccines could possibly do to our children, we do not know the long term side effects, we do not know how this vaccine will be viewed in the years to come. PLEASE leave it to parents choice!

I would hope that taking into account

II. Disease Burden Criteria

5. The vaccine containing this antigen prevents disease(s) that has significant morbidity and/or mortality in at least some sub-set of the population.

That you all will realize that this vaccine does NOT prevent this virus.

This vaccine is just like the flu shot and shouldn't be required for attending school.

Subject: C-19 shot for children

External Email

Hello,

There is no published literature currently on pediatric covid-19 effectiveness in K-12 school setting.

And let me just add that every person is different and we don't all tolerate everything the same, any vaccine, medication, or treatment for ANYTHING should be a decision between parent, physician, and child. These are basic rights we have and it is NOT the decision of the school or any other to force anything, especially an EXPERIMENTAL DRUG.

Imagine if you will, this is YOUR CHILD OR GRANDCHILD, and your doctor has many concerns about the treatment and health of YOUR child.

Imagine he says "I would NOT advise this shot, medication, or treatment. But YOUR CHILd MUST get it NO MATTER WHAT! The company that makes the drug, has no liability if HARM comes to YOUR CHILD. You would just say, " oh well they say we must so who cares if you have adverse reaction or death.

I really doubt any of you would put YOUR CHILD up as a genie pig, ESPECIALLY when they already have NATURAL IMMUNITY, from having covid already, and/or they have very small if not no risk. You can still get and spread covid vaccinated or unvaccinated COMMON SENCE says those two are the same.

Respectively, you , the state or GOVERNMENT are NOT the boss of people, or their children or family.

This is unconstitutional, and in my home YOU ARE NOT GOD. The risk is ours, we can take it or not ... NOT YOUR DECISION.

Dear WABOH:

I write to strongly OPPOSE adding the COVID injection to those required of school children. These shots are still experimental. We have to wonder why the FDA pushed to conceal for 75 years, the data collected by Pfizer on adverse reactions. Children are not at great risk from Covid.

I urge you to VOTE NO.

Sincerely,

Karen Demaree

Subject: Vanessa Thacker Absence 2/1/2022 & 2/2/2022

External Email

I am very disheartened by discrimination I am experiencing from Green Mountain Elementary School. My 5th grade daughter, Vanessa Thacker, is not allowed to attend school on 2/1/2022 & 2/2/2022 against my will.

I received an email and phone call on Monday 1/31/2022 that my daughter was "exposed" to covid through the bus ride to/from school last week. I was informed that she is only allowed to continue to attend school if I sign over my rights to let a nurse give her a covid test on 2/2/2022. This would allow her to attend 2/1/2022 and 2/2/2022. However, if I chose to test her myself as her parent and legal guardian, she is NOT allowed to attend school until she can provide a negative test performed on 2/2/2022. This means she misses a full two days because I am not willing to sign the test to stay document. If I desire to test her as her parent, then she is not "safe" to attend class on 2/1/2022 and 2/2/2022.

Her rights as a student have been taken away. This is completely absurd. Where is the science that says if a nurse has a list with her name on it, waits 48 hours to see her to perform a test, indicates she is safe enough for her to be in attendance of her class?

To take away any student's right to learn in this manner is pure discrimination.

I believe it is completely unfair to push these children around like pawns, as if their education doesn't matter.

Covid is no longer an emergency. Vaccinate or mask up for hours during school is unethical. The survival rate for children is 99%!!! Why would we continue to put children up to unknown long term side effects of an EUA vaccination (this vaccine is still in investigatory stages)? Studies prove vaccinated individuals still receive and pass along the virus. Risk of vaccination is significant and STRONGLY outweighs any proven benefit.

Following mandate(s) risks:

1. Unknown long term and short term side effects of Vaccination.
2. Limited oxygen intake to the body and brain due to masking during normal and athletic activities for hours at a time.
3. Unknown long term and short term mental health issues.

4. Unknown long term and short term communication issues.

All risks for a benefit of what? Surviving a disease that is treatable. Surviving a disease that has a survival rate of 99% in their age group? Also, what about natural immunity?!

Jan. 31, 2022

Dear WBOH Board of Directors, and
Technical Advisory Group (TAG) members,

Comments on the topic of "constructive oversight of communicable diseases & general health of Washington residents" - related to concerns around the genetically engineered COVID vaccines.

Here is the current job description (on 1/20/2022) of your group from the Dept. of Health website [.https://www.doh.wa.gov/AboutUs/PublicHealthSystem/WashingtonStateBoardofHealth](https://www.doh.wa.gov/AboutUs/PublicHealthSystem/WashingtonStateBoardofHealth):

"The 10-member Board of Health provides a citizen forum for the development of public health policy. It recommends strategies and promotes health goals to the Legislature and regulates a number of health activities including drinking water, immunizations and food handling. The Board is housed with the Department of Health although it is an independent entity."

1. I want you to remember that "The Supreme Ruler of the Universe" is in our Preamble of our State Constitution, and that the Declaration of Independence can be seen as a Primary Preamble to our U.S. Constitution - and we can interpret its phrase "All Men are created equal" to "God loves all humans as good-hearted parents love their children. God may have a special plan for each person's soul, determined before birth."

Thus, I ask you individually to consider being thankful to the Supreme Ruler of the Universe and attempt to align our Department of Health to please The Supreme Ruler of the Universe.

Residents need to look at the Bible as a whole, culminating with the New Law (people filled with the Holy Spirit, thus having an internal law or conscience), and Jesus' guidance to fight spiritual rather than physical battles with the great help of God and Jesus. Residents need to notice that peacemakers since the time of Jesus are to be considered "sons of God" (a highest position).

The Bible teaches us to move from animality to being "upright" / civil.

I hope each resident can come to know in this state that this is their choice: to be animalistic or to follow God and Jesus to be "upright" and civil.

Caring for our health, not putting into our bodies toxic things - that is upright and civil behavior. To just eat what tastes good, that is what children do who have not yet learned important things about health.

I realize there are many residents and maybe many staff members who haven't looked closely at most of the 66 books in the Bible (some are only a few pages like the book of Jonah and Paul's letters), and so many would not know these things about God, Jesus' Heavenly Father, and the Holy Spirit, Jesus' Heavenly Mother, or Jesus and his teachings. I think it is important for individuals in this state to not only look at the guidance towards civil code of conduct in the Bible, but to notice how God guided many cultures around the world to be upright and civil with many of the same customs - like marriage is between a man and a woman. We see the virtues being honored and developed as well. To be human is to be humane. We have a ways to go.

Another important reason for us to recommit ourselves *individually* to looking up to The Supreme Ruler, is that when we look to, give thanks to, and try to please The Supreme Ruler of the Universe, (who I understand as the God of Abraham, or Self-Existent One), then we don't get "Relative Morality." We don't get some powerful people who decide some of TSRUs children are of no value and thus should be killed.

Not everyone notices that God told Abraham in Genesis 12:3 that all nations shall be blessed from him. And not everyone notices that Paul (who it seems spent 3 years learning from Jesus before his ministry started) told the Galatians in chapter 3:29, that if gentiles follow Jesus, that they are Abraham's seed.

If we look to TSRU (Self-Existent One) and *individually* seek TSRU's (Self-Existent One's) wisdom in the Bible, more of us will see what [he] told Jeremiah in Chapter 1 of the book Jeremiah: "I had plans for your soul before you were in the womb."
<https://biblehub.com/interlinear/jeremiah/1.htm> So, if we come to believe this, we thank Self-Existent One by caring for all humans, even those in the womb. If a woman doesn't want to care for the baby, later she might want to, but we can think the child is God's child and care for it as such.

2. I believe you Washington State Board of Health members can best serve The Supreme Ruler of the Universe if you create a completely separate Washington State Department of Holistic Health - separate from the current Washington State Department of Health. The latter can more accurately be renamed the Department of Medical Intervention. The staff of both departments should be personally thankful to the Supreme Ruler of the Universe [the Heavens] and willing to put God above the dark spiritual leader "mamona" that has to do with putting the pursuit of money over The Supreme Ruler of the Universe.

At first the new department would be best housed at a different building, with staff to review research done around the world. State employees who are thankful to The Supreme Ruler of the Universe and who chose not to get injected with the artificial and possibly toxic, Nano items during this pandemic would be good candidates to work in this department.

This department would analyze and share information that might help people regardless of whether or not anyone can make money off the modalities. In the Bible's book of Matthew,

Chapter 6 verse 24, Jesus said: It is not possible to serve two masters...Jesus (listening to his Father in Heaven, The Supreme Ruler of the Universe ["the Heavens"]), called followers to serve God, rather than "mamona" (the god of money/wealth/shiny things).

<https://biblehub.com/interlinear/matthew/6-24.htm> Some of this information would be what nutrient help boost people's immune systems, and what tests indicate a strong immune system.

3. In the Preamble of our State Constitution residents are called to thank "The Supreme Ruler of the Universe."

It makes sense to clarify "the Supreme Ruler of the Universe" as the God of the Bible.

If we clarify The Supreme Ruler of the Universe is the God of the Bible, we stay consistent with the law of our nation - as we consider the Declaration of Independence and how we fought and won Independence from Great Britain, with the God in the Bible in the picture. So it makes sense we would offer thanks to this God--who claims to be a Supreme Ruler of all things created in Heaven and earth (see <https://biblehub.com/interlinear/colossians/1.htm>, verses 15-17. It sounds like some connection with DNA to me) -- for this victory, and other blessings. Because we won the war, we can worship God freely and not have the Church of England, and other English leaders overseeing our nation today.

Signers of our Declaration of Independence had the God of the Bible in mind when they "put their lives on the line" in calling for our independent, "united states of America." They signed that document feeling that the God of the Bible would help us to win our freedom from tyranny. Residents prayed to God --"in the name of Jesus"-- to help them survive and be victorious in that war. Many of the Revolutionaries drew strength from biblical stories where God helped his followers first physically conquer barbaric opponents (in the Old Testament), and then spiritually conquer unseen malicious opponents (in the New Testament) with Jesus/Yeshua.

4, The term "Supreme Ruler of the Universe," allows us to explore how the "God Almighty" we see in the Bible may have guided other cultural groups around the world.

(we look at the moral law - however we are looking at if they follow the law that coincides with our laws: the law 2.0 in the New Testament - Love God and love one another, as Jesus demonstrated love, and as we love ourselves. Also the New Testament Law or moral code of right and wrong can be within each person as they directly connect to God's Holy Spirit for best action and guidance. Paul talks about this "new law" in his letter to the Galatians -- when we ask for and are filled with the Holy Spirit, we want to do the right thing.

5. How does our State Constitution Preamble relate to encouraging health for our residents?

It should be helpful for health and wellness if residents are encouraged to talk to one another about "The Supreme Ruler of the Universe" and the varied religious and philosophical belief systems here where the areas of overlap are and where the areas that differ are. Religions and philosophies that guide people to do things that are "right" and "good" according to how Jesus clarified these things, should be compatible with our laws.

We can thank God by caring for ---furthering the health of--- our species, other species, our ecosystems, and our atmosphere of our planet. Our health is connected to the health of all of these things. Helping the health of ever creature on earth comes back to help out the health of our residents. We can thank God by protecting our amazing DNA and our amazing immune systems. We thank and honoring God by protecting God's design, God's creations.

We can also thank The Supreme Ruler of the Universe, by pleasing this God. People should know that early founders read the Bible and understood we are to follow the New Testament Law 2.0 that Jesus demonstrated. It was to focus on loving God and loving one another as Jesus showed love, and as we love ourselves.

Our laws in the U.S. and State follow "God's law 2.0" in the New Testament of the Bible that Jesus demonstrated.

According to God's law 2.0 of the Bible, "the Body of believers is the Temple." Also each human body is a temple. We are to care for each of our bodies as together they are the new temple to God. Each body of a believer can house God's Holy Spirit.

Things may go better than worse for us in our state if we will individually encourage one another to learn about, and thank this God, by putting this God above other "small g" gods such as science, pursuing money (mamona is the god of money/wealth/shiny things). This is the first part of "God's law 2.0" which corresponds to the first few of the 10 Commandments - to love God above other things.

It can help save lives to let people know that if they are not aware of the need to ask for the guardianship of the Holy Spirit, then they can acquire a downward-pulling spirit. This is also an issue of health - downward-pulling spirits are involved in depression, suicide, drug abuse.

6. What about residents who don't like to hear the title "The Supreme Ruler of the Universe?"

If people are possessed by a malicious spirit, or are not familiar with the stories of Father God, the Holy Spirit, or Jesus, or for other reasons, they sometimes don't want to hear these sorts of spiritual terms.

I know of 2 young adults who have gone through the public educational system in Washington State without parental coaching about God and the Bible when they were in elementary school. Later, even with a parent encouraging them to read some of the Bible or listen to stories, they want to avoid the topic of Bible stories, lessons, and learning about God. They may have learned in public school to NOT look into who "The Supreme Ruler of the Universe" may be. It seems for the health of our state, it would at least be good for public school curriculums to have teachers point to The Supreme Ruler of the Universe being in the Preamble of our Constitution, and encourage students to get with their parents and look into who this is to them. And that students should feel free and be encouraged to relay experiences with this Divine Being that have led them to believe in the existence of this God above other gods. It seems teachers could support an atmosphere of respect and encouragement for any students to share their understanding and thanks for this God.

If people don't think this God exists, or don't like this God, it should be reasonable if they can voice their concerns in a respectful way and put up with a reasonable amount of thanksgiving of others in public forums.

We also can thank God by reminding one another it is okay to take time in public settings to recall and share God's wisdom and guidance in the Bible.

It may be helpful to let doubters learn that scripture in the Bible indicates that if we do not search for God, God will leave us alone. (See the book of Jerimiah, around Chapter 29). It could help if non-believing residents could learn of testimonials of how some residents believe they were helped by "The Supreme Ruler of the Universe." It could help if non-believing residents could know that God loves them.

Since your role is to

More residents might value the Bible and it's teaching stories, and take it more seriously if they knew scriptures have been carefully copied and Modern Hebrew was developed to have a number associated with each letter so that numbers above each line could be tallied up at the end of each line to ensure correct copying of each line. This occurred ~500 years B.C. during the Babylonian Exile. In the 1940s and '50s, many of the scriptures in the Bible were found including books with Ancient Hebrew, written before ~500 B.C.. The entire book of Isaia from ~700 B.C. was found. The books were in the form of scrolls. They were stored in long clay jars in the Dead Sea Caves. This showed that the content of the books had not changed over time. Most residents probably don't know about many important archeological findings that point to the Bible being a collection of stories rooted in historical events.

To help with the peace (low-stress=health) between our residents, somehow it would help if more parents could read the Bible and teach God's law 2.0 to their children. We can have greater peace in our state if more residents come to understand God's plan is to treat each other as beloved brothers and sisters. We can view The Supreme Ruler of the Universe like a loving father and a loving mother. ("Father God" and "The Holy Spirit" -- in the Old Testament

The Holy Spirit is described with "female gender" Hebrew words such as breath, healing, and wisdom.)

connecting with other residents to know that it is a free-will choice if they want to read and study the teaching stories in the Bible and then to see the merit of following God. We can encourage parents to study the Bible and teach it as it makes sense to them.

If residents know moral guidance in the Bible as Jesus clarified, then residents can compare and contrast how other religions and philosophies match up. It is likely God spoke and guided cultures all over the world with similar moral teachings.

There is still free choice. Some people become angry at God, or haven't seen, or heard proof of, God's existence, (i.e. testimonies from people they believe), so they don't believe in God. We can ask one another which of these things is happening. Some people also haven't heard stories of God's benevolence and justice.

Harboring negative emotions we now know can lead to various states of physical dis-ease. The Christian counselor Charles H. Kraft, in his book *Deep Wounds Deep Healing*, tells of many Christians getting released from negative spirits just by giving negative memories over to Jesus.

I understand "The Supreme Ruler of the Universe" to be "LORD" or "Yahweh." Yahweh is from YHWH - Modern Hebrew alphabet letters. The Ancient Hebrew term was YHVH - pronounced Yod-Hay-Vav-Hay. Some of us understand the name to mean "Self-Existent One." There has recently been a vision of an initial cubish design (Logos/Frequency/Utterance) with balls at the corners that began the creation of this universe (or multiverse). This was uttered by this God.

The term "Lord" in the Bible tends to generally refer to Jesus. People can resolve some conflicts by looking at the original Hebrew terms in the Old Testament and original Greek terms in the New Testament. One can find these at Biblehub.com with the Interlinear Chapters version. Jesus to be a God above other "small g" gods, but not the God of Creation.

a.) Regarding the topic on Jan 12 WSBOH Public Meeting Agenda about adding Washington Code language to reduce stigma, fear, and prejudice for people with HIV, and about allowing people to legally use a gender pronoun that is not aligned with their birth gender.

Because our Constitution calls residents in the Preamble to thank The Supreme Ruler of the Universe," and because this mirrors our U.S. Constitution which has our Declaration of Independence as a Primary Preamble,

And because our early lawmakers sought to bring God into discussions of public policy,

And because early residents read the Bible, and so held up the God of the Bible above the government, (as we see in our preamble statements),

We can clarify that “God” and “The Supreme Ruler of the Universe” are the same as the God in the Bible.

Some see God as one in the same to include Father God, the Holy Spirit and Jesus.

Some of us see God as “Self-Existent One” -- The Supreme Ruler of the Universe/of the Heavens -- who encompasses a Father aspect (“Father God”), and a Mother aspect (“The Holy Spirit”). And we see Jesus also as a God, a God above other “small g” gods, specific to overseeing our planet and humans, and maybe this area or the cosmos. We understand Jesus works in unity, as One, with Self-Existent One. And we understand “Self-Existent One”/The Supreme Ruler of the Universe” gave Jesus all authority over Earth and the Heavens. However, since we see Jesus sitting on the right hand of his Father after his ascension to Heaven, it is not apparent in scripture that Jesus accepted that invitation.

So as we affirm our laws are consistent with the teachings of Jesus, the son of Self-Existent One, sent for humans especially, we can note that Jesus clarified the most important laws for our time by demonstrating that humans are to be civil and to care for one another.

Since our laws are based on the Bible, residents having any pathogen can know to look to The Supreme Ruler of the Universe, and love one another as Jesus demonstrated love.

Thus we don’t need an extra clarifying code for how we should treat people with Human Immunodeficiency Virus (HIV). They should be treated with kindness, because they are God’s children. (But humans have free will, so we can pray that people come to know this guidance, and the realness of God/Self-Existent One/The Supreme Ruler of the Universe.)

However, there is ignorance about this virus and how it transmits. Thus, people need to know adequate information so that they can understand what their personal risk is regarding the transmission of HIV. People need to know if it is true that if HIV-positive people are doing certain things to keep their immune system in good shape, and if the virus is on any fluids like from a paper cut, that if the fluid doesn’t get into their fluid, they should not get the virus.

People need to know if it is true that if they have their immune system in an optimum condition, even after exposure to HIV or many pathogens, including SARS Cov2 and variants, that they will not likely catch this, or it will not likely spiral out of control. There is a need for state testing and state-verified data around pathogens.

Any laws concerning HIV could possibly extend to SARS Cov2 because I saw Luc Montagnier saying the HIV genome is within the SARS Cov2 genome. (!) We could look into this. Luc Montagnier, is originally from France. He won a Nobel Prize for discovering HIV. Wikipedia

relays that he now works at a University in China. As we consider saying anything about this code, it should be wise to determine if HIV *is* within the SARS Cov2 genome or not.

Whether or not this is the case, it should be helpful to be open about this along with reducing stigma by pointing out how great it is that people with HIV have been able to reduce even the transmission of HIV if they are diligent to care for their health and/or also use retrovirus drugs to keep the virus in remission.

Stigmas even happen now with the COVID injected and the COVID19-uninjected people.

A simple answer is that we can just go back to the simplified law to love God, and love one another as Jesus demonstrated.

People need to have support to do what they feel is the best to care for their bodies as their temple (if they are going to follow Self-Existent One's guidance in the Bible relayed by Jesus).

b.) Regarding the topic on Jan 12 WSBOH Public Meeting Agenda about adding Washington Code language to allow people to legally use a gender pronoun that is not aligned with their birth gender:

As far as introducing new gender descriptive terms to our code of law, I recommend that as we point out that many residents remain thankful to God, the Supreme Ruler of the Universe (or multiverse),” for helping earlier settlers win the war to be Independent from the Church of England and Monarchy of Great Britain. Two Washington residents understand it is God's plan for people to "stick with the gender they were born with." Thus to remember God I recommend we identify people according to their birth gender. People could say, “(name), birth gender: (M or F), so for formal processes they could be referred to according to pronouns that fit with their birth gender. This will also help in their medical care and to prevent things like men acting like women and winning women's races, men acting like women and sneaking into women's locker rooms, and other acts of deception.

God allows freedom of choice, but it can be seen as against God's plan for residents to try to change their identity to different than their birth gender.

Parents should know the first Chapter of Jeremiah in the Bible. It is where God says he had a plan for Jeremiah before he was in the womb. So this may be true for all humans. It is my opinion that we can try to discern the plan by looking at the family structure and maybe the place we were born into, as well as our gifts and any prayers righteous people may have given before our birth.

Parents should also know that “God is angry with parents who allow mutilation of any child's birth gender.”

<https://peacewellness.wordpress.com/2021/07/05/god-is-angry-with-any-parent-who-mutilates-their-childrens-birth-gender/>

c.) Wise Management of the Earth's systems - and Sexual Self-Control

It is my understanding that God has intended sexual self-control and that sex is for creating children. It was created to be pleasurable so that our species would "be fruitful and multiply."

In my opinion the words that got translated as "have dominion over" and "subdue the earth" can be better interpreted as "manage" (the Earth) -- and wisely manage makes sense. So until we do better to feed, clothe, and educate every human it seems (this is my opinion) we should try to encourage residents to try to limit the number of biological babies we have - like to 1 or 2.

All residents over around age 16, not just eunuchs, could read the first few chapters of the Bible's book Romans. Residents can notice Paul was encouraging people to practice sexual self-control.

d.) God and Jesus both said "Marriage is between a man and a woman." This is so children can have a role model of their gender.

We can encourage parents to look at Genesis, Chapter 2, where God said marriage is between a man and a woman, and where Jesus repeated this in Matthew , Chapter 19. It is up to parents to teach this to their children if they so desire. Parents can decide if it may be that God has this plan so that children can have a role-model for their gender. Parents can decide if they want to follow the wisdom of "The Supreme Ruler of the Universe" [of the Heavens] or not, and if they want to teach this information or not to their children.

e.) Eunuchs who align with God, can have high place in Heaven, and Jesus hints that it is better for eunuchs not to marry.

In Matthew, Chapter 19, Jesus encouraged married couples (if possible) not to divorce. Then a listener commented, "so it is better to not marry."

(<https://biblehub.com/interlinear/matthew/19.htm> -- verse 10) Jesus answers this statement "so it is better not to marry" saying "some eunuchs were born that way, some were made that way." So we in this state can align with God by calling LGBTQ+ residents, "eunuchs." Then we can direct these residents to the first part of Isaiah, Chapter 56, (<https://biblehub.com/interlinear/isaiah/56.htm> -- verses 4 and 5) where God says if eunuchs please [The Supreme Ruler of the Universe], they can have a place within the walls of [The

Supreme Ruler of the Universe].— they will have a name better than that of sons and daughters.

There is also a story of a trusted, noble, God-aligned Ethiopian eunuch in the Bible's book Acts. This eunuch was pondering the book of Isaiah when Apostle Philip met him. Philip showed him how the scripture pointed to Jesus as the awaited Redeemer-Messiah. God allows the Ethiopian eunuch to accept Jesus as the prayed for Messiah, and after hearing the story of Jesus, he asks to be baptized. So we could call eunuchs to also look at the story in the Books of Acts.

f.) Without God, people can come to sacrifice infants and children to “small g” gods.

[The Supreme Ruler of the Universe] gave the prophet Ezra a prayer, the Amidah, for the “Faithful Remnant” (called “Jews” because they were from Jerusalem during their exile in Babylonia; they followed God’s prophet Jerimiah to go to exile in Babylonia). So after they returned to Jerusalem and rebuilt the temple, Ezra had them pray the Amidah “the Standing Prayer” three times a day. In the prayer they asked God to redeem the family of Israel of their great sins of turning away so many times.

Some of the Israelites who were not the “Faithful Remnant,” had turned from God in different ways, including sacrificing infants and children to “small g” gods. I understand this practice went on even in the times of Abraham.

Some humans still sacrifice infants for various beliefs today. This still happens in Uganda today and even in this state for occult practices.

Some view abortion as not honoring that God’s has stated he has plan for each human before their soul is in the womb.

7. I oppose SARS Cov2 vaccine mandates and forced injections in this state. This is in regards to a rule that appears to be on the Washington Code (WAC) 246-100. I understand these codes were put in the books around 2003.

I oppose any vaccines being administered without fully informed consent. Pediatricians and other general doctors in this state have not been fully informing residents of adverse effects of all vaccines as I have seen. Residents should be told if there were successful court cases regarding vaccine injuries as well as summaries of known vaccine adverse effects.

One part of this code sounded like police might be able to forcibly inject someone with a vaccine (or a medicine). I am opposed to this - especially if it is genetically modified material, and contains toxic chemicals in it. Also if the person doesn't really know or trust what is in it. If people are being dangerous, even coming off a strong opiate, there are calming tones and

detoxification foods, and teas that could be offered if a person asked for them. Also a person in a mental hospital or some sort of facility with oversight, should be offered the choice to see if reading scripture might help.

I object to hospitals or any care facility to vaccinate someone against their will.

I have heard of two cases where young vulnerable women were recently in different King County hospitals --for mental health reasons /one was on a floor also for drug rehab I believe, both were possibly considered homeless -- and both were forcibly injected with a professed anti-COVID vaccine! One was the daughter of a friend of mine. This friend now lives in another state. Her daughter was in a King County or Seattle-area hospital around November, and escaped the hospital to avoid getting vaccinated against her will for a second time. She made it to the state her mother is in. I think these two young women should get a representative to get some compensation for stress. Can you look into this and let me know how we can help get justice for these travesties and prevent others?

8. Powerful economic entities in our state and in our world seem to have influenced our health policies towards profiteering rather than pleasing God. I want you to consider walking in solidarity with our founders who chose God as their ally.

Until our Department of Health can be more aligned with what pleases God, I want the Washington State Board of Health to call for a separate "Department of Holistic Health" to educate residents about

Jesus said to choose to serve God or mamona/money. (Mamona is a "small g" god - a god of money, wealth, shiny things). As we drifted away from studying and seeking God in this state, and aligning our people with God-- above the government-- we put "Economic Growth" or "Economic Progress" up as a false idol.

It can improve health and save lives if more and more residents decide to put "The Supreme Ruler of the Universe"(or Multiverse) above other things - like the pursuit of profit. Many residents here--including parents, teachers, school board members, professors, business leaders, politicians-- don't know or have forgotten that thanking "The Supreme Ruler of the Universe" is mentioned first, above our highest state law, our Constitution.

Take courage if pressured by seemingly powerful "economic entities" by looking at the Old Testament battles where God led a large group of shepherds and former slaves to have victory over opponents who were giants and cold-hearted leaders. God led Gideon to have victory over powerful opponents who were as numerous as sands on the beach.

Work for a "Department of Holistic Health" independent from the current "Department of Health" which could better be named the "Department of Allopathic Medical Intervention."

9. The God Gene - Genetically-engineered spike-protein, or other vector, mRNA vaccines could alter people's DNA and should be considered illegal in Washington State and the United States.

Gene-therapy-type injections can attack a gene that helps people connect with God.

A search on Wikipedia around October of 2021 indicated that there was a book called *The God Gene*. It was published around 2003, and authored by Dean Hamer...

Hamer writes in the book that he wrote the book on the side of his normal job at the National Institute of Health (NIH). He said he got the funding for the book's topic via the Templeton Foundation of Pennsylvania. This organization has a huge fund to direct money at the topics of Science and Religion. Temple sounds like it could be related to the Israelites who don't believe in the New Testament, but I only see that a man with the last name of Templeton died and left his fortune to this foundation.

In the book, Hamer indicates a PCR test was used to isolate and compare a certain part of the human genome. He interviewed many people who were drawn to connecting with a higher power. He also compared genes of siblings where one had a great interest in seeking spiritual experiences while the other did not have this interest or a gift in this area. He claims to have discovered a specific group of associated genes (I believe it's called an allele) that corresponded to whether or not a person had an inclination for having a mystical experience.

The Bible has important people that God designates to be spokesperson for God. In the first Chapter of the Bible's book Jeremiah, God (YHVH - Yod Hay Vav Hay/ YHWH "Yahweh") says that he had plans for Jeremiah before he was born. It is possible that God intends what person gets a God gene and who doesn't. We also hear God say at one point that those who sacrifice their babies and children to "small g" gods - are taking his children. In the time of Moses, God said at one point that followers are to give their firstborn child and their firstborn son to [him].

Since we thank God in our Washington State Constitution's preamble [for helping us win the Revolutionary War], it is not consistent with a thankful attitude to allow possible harm to anyone's birth DNA.

Even if someone does not currently seek to follow "Yahweh," at some point in the person's life, they may want to. It is not at all informed consent to not tell people that their DNA, and possibly unique ability to connect with "Yahweh" could be altered with this gene-therapy-like injection.

People who read the Bible should be able to see a major point is that there is a war of unseen forces of good and evil. Injections containing toxins appear to many of our residents to be in the category of entities that are malicious. In the Bible, we see teaching stories of humans who

acquire malicious entities. Sometimes people get these and are not aware they are being controlled. Around 2003 people were learning that thimerosal, a mercury derivative, was in many vaccines.

10. Encouraging Civil Culture - via Civil Genes, Healthy Brains, Healthy Hormone Levels, Encouraging the Holy Spirit in People

We must be on guard for any less-than-virtuous/less-than-human behavior. We must try to discern if it is due to

--estrogen reduction like from hormone organ damage, (men as well as women produce estrogen - a hormone which may allow one to be more caring.)

--brain injury and/or brain inflammation (some head injuries may make people violent). Inflammation can be from chronic environmental mold, immune reactions to foods, toxins, drugs, accumulated nano genetically-engineered spike proteins, or a type of microbe.)

--a gene group (allele) associated with animalistic behavior. (If we find such a type of allele, we might invite individuals with this to try gene therapy to see if those alleles can be altered to make a civil allele. Or maybe we need these groups of humans to defend our species from outside attacks.

--drugs or toxins that affect people's brain structure or chemistry.

--malicious spirits (These can be drawn into people if they don't know how to protect themselves. Reading and studying the Bible --especially the first 5 books of the New Testament-- helps, baptism helps, asking Father God, the Holy Spirit to be around, "in the name of Jesus," helps. People can also acquire these also after any trauma—including when the human body, "or temple," is punctured, such as with a vaccine or injection. When people don't know that malicious spirits can exist, they can be vulnerable to becoming possessed by these spirits. Malicious spirits can cause drugged or severely depressed persons, for example, to harm themselves or others.)

--low blood sugar issues

If a civil society is a goal, then insurance carriers could be required to pay for people to get SPECT scans if they want, and incentives could be made, to check if our brains are as healthy as they can be.

People should be able to self-refer to get SPECT brain scan imaging, the kind that is done in Dr. Amen's clinics.

Our mental health professionals could check for possible brain inflammation from food by referring patients to the kind of naturopathic doctors who can order and assess IgG blood tests

for food and toxins. If we want to encourage civil society, we would also have insurance companies to pay for this sort of thing.

Do mental health professionals in this state have these things listed in their diagnostic manual? I think these things should be added as things to screen for in this state.

Then the counselors could also encourage and assist clients to follow through with testing. They could also suggest a possibly possessed client read some books like *Deep Wounds, Deep Healing*, by Charles H. Kraft, and /or *The Bondage Breaker*, by Neil T. Anderson, and visit a trained and successful Christian or Roman Catholic team of exorcists.

At the time of Jesus the Israelite religious leaders were doing special cleanliness rituals that poorer and physically challenged people could not do. The Israelite priests took a high path to the temple after cleanliness rituals, but then at the Temple, I understand they were clubbing unclean, poor, and disabled people to force them out! Jesus demonstrated this was NOT "the Way." Instead he demonstrated the "narrow path" -- to focus on the moral law to love and care for the needy, even if they had "unclean" diseases.

Jesus showed the connection between malicious spirits and dis-ease, and he showed how to cast out troublemaking spirits. He worked with God's Holy Spirit to heal people and raise the dead.

So counselors could also tell clients that the New Testament gives clues to getting clear of negative entities by asking for God's the Holy Spirit to be in and around a person --continually.

A key thing to learn is in the New Testament, Jesus showed us about spiritual warfare. It is helpful for all residents to learn that God, the Holy Spirit, and Jesus can help people who pray - even silently - to overcome any challenge. This relates to physical and mental health.

Malevolent spirits can assist people to get more depressed, more anxious. Their goal is to "take a person down" completely - to die in a mental state apart from God. So if a person in mental distress as well as physical distress can just ask for Jesus to be with them, and then read some passages of the Bible out loud-- this can help to physically as well as spiritually save lives. And doesn't cost anyone any money. (People can usually acquire a Bible for free at a church or from many Christians - or there are free apps like biblehub.)

11. Ensuring homeless waste is cleaned up - public sanitation

Each city could have teams to clean up after homeless who may leave clothes, needles, human feces. Dogs could be trained to help people find the spots to clean up. Human waste could just be buried in 1 foot deep holes.

At each of the Day Shelters there may be people who are open to volunteering to help. It can be pointed out that if they do well they can maybe get recommendations for other jobs - maybe even jobs with the city.

12. We might be able to simplify our excessive codes and laws if we follow the example of how Jesus simplified the excessive laws.

Jesus simplified the complex and excessive laws the Israelites had developed by his time (some were ritualized cleanliness rituals that not everyone could do and it is possible some were made up by the Levite priests, maybe there are some in the book of Leviticus).

We can see early in the book of 1 Samuel that only the spokespeople God chose were supposed to be the leaders. So by the time of Jesus, the Levi priests were not to be claiming authority to make up excess rules and then look down on people who were not able to follow them.

Here is how we can simplify our laws and codes: Jesus clarified that loving God and caring for one another—all humans, all of God's children—is the most important law. Moses relayed this same law from God in earlier times. So we don't need lots of detailed laws if we will just encourage people to read the teaching stories in the Bible and understand the teachings culminate with the clarifications that Jesus demonstrated.

Thank you for reading this and considering these concerns.

In service to The Supreme Ruler of the Universe [of the Heavens],

Board of Health: To Whom it may concern

I think temporary paralysis, motor control deficiency, and behavior problems in children are not physician recognized as associated with current COVID vaccines, but they are showing up in the VAERS database. Neurological effects may be underreported in VAERS if they are not identified as associated with the vaccines. VAERS database number 1951967, a 13 year old boy in Wa State fully functional in daily activities but with a known DNA defect (deletion) prior to injection with Pfizer BNT. Two days post second injection began non stop talking 27/7, insomnia, and random giggling and became unable to follow a single command at school. He lost personal independence in daily activities. MRI of head and lumbar puncture and EEG were accomplished. No outcome listed as of three months following onset as listed in the VAERS detailed event report. Mother requested help with the situation in VAERS. I hope someone from the state health department has looked into this case to see what help can be given to this mother. I hope this case [DNA deletion] and impact with mRNA mediated vaccine is investigated. It may shed insight into other behavioral changes reported in VAERS.

Children 17 and younger in 2021 VAERS reports had 44 heart disease cases and 5 serious neurological problems. Forty-three heart disease cases in children followed the second dose and one followed the first dose of the Pfizer Biontech. For the child affected following the first dose of Pfizer Biontech is the state going to mandate a second shot?

I read several hundred of the detailed reports on VAERS regarding deaths and serious injuries to people of Washington State. Quite a few of them are written by doctors and are useful. Almost all of the 44 serious heart reactions in children 17 and under were evaluated by doctors and included data on Troponin, C-Reactive Protein and or Brain Natriuretic Peptide levels and likely diagnosis.

The International Alliance of Physicians and Medical Scientists published a declaration now signed by 17 thousand physicians and medical scientists that healthy children should not be subject to forced vaccinations. They included a link to the evidence supporting that position.

Review of patient survival rates among patients who receive early treatment rather than waiting to go to a hospital shows government is not good at innovative solutions. After two years of dealing with COVID, the CDC website still has no protocol for early treatment of COVID in spite of hundreds of studies proving early treatment statistically benefits patients.

Myocarditis and pericarditis were listed in the Emergency use Authorizations but not determined to be a symptom directly related to the vaccines in all the manufacturer testing and in all the rounds of vaccine release which took place over many months from older to younger and was not identified as a risk until children developed heart disease. That one patient who developed heart disease after the first Pfizer dose had a medical history of autism.

The International Alliance of Physicians and Medical Scientists published a declaration now signed by 17 thousand physicians and medical scientists that healthy children should not be subject to forced vaccinations. They included a link to the evidence supporting that position.

My son experienced thrombocytopenia and bleeding in mouth, skin and brain from a vaccine. Some people in my house have allergic reactions to vaccinations. COVID already ran through our house. Is the government is considering mandating vaccines to the whole population?

I have not read any studies proving the gene therapy vaccines slow spread of COVID transmission, but I did read one study that showed an inverse relationship. Possibly because more people with mild cases don't know they are sick but are still capable of spreading virus.

Also civilized people would not consider coercing Amish, Ortodox faiths, native Americans, into taking vaccines if it was against their choice. I believe it is clear, informed choice in a free society is the only way ethical people would administer these new gene therapeutical COVID vaccines.

Thank you for your work
To everyone's health
Very Respectfully

RE: Billing the Washington State Board of Health for Your Outcomes (or lack thereof)

A specific matter of public health policy surrounding COVID – or lack thereof – is resulting in myself and other Washington State residents being denied timely and efficient healthcare. This creates unnecessary anxiety, unnecessary pain and suffering, and – sometimes - negative health outcomes and/or financial distress. I am contacting you to have you correct this matter of public health policy.

CONTEXT: From both a public health perspective and an individual health perspective, the medical system has existing policies regarding certain medical transplants and joint replacements. Specifically:

1) I have a neighbor who needs a knee replacement. Medical providers refuse to do a knee replacement until my neighbor quits smoking. She's being required to participate meaningfully in her own health outcomes. She won't quit smoking, she is now hobbling around with mobility devices as a result of her unwillingness to stop smoking to receive a needed knee replacement.

2) A friend of mine also needs a knee replacement, but she is medically obese. Doctors told her that she needs to lose weight before they will do a knee replacement. She's already lost at least 30 pounds so that she can get a knee replacement.

3) When heavy drinkers (alcoholics, et. al) need a liver transplant, medical providers often require such individuals to achieve a period of sobriety before they become eligible for a liver transplant (six months sober or?). There aren't enough liver transplants available to meet public need, so it's in the interest of public health for liver transplant recipients to be in a position to have positive outcomes (i.e., quit drinking).

HOWEVER, THE SAME PRINCIPLES ARE NOT BEING APPLIED BY HEALTHCARE PROVIDERS AND/OR THE WASHINGTON STATE BOARD OF HEALTH TO THE COVID PANDEMIC. Unvaccinated COVID patients are being allowed to overwhelm our medical system to provide them with avoidable hospital care that could be avoided if such persons were held responsible for participating in their own medical care (i.e., requiring vaccinations for hospital admittance). As a result, myself and multiple other vaccinated Washington State residents who need non-COVID medical care through no fault of our own are being denied access to timely medical treatment because hospitals are swamped with unvaccinated COVID patients. shots/2022/02/04/1078029696/americans-get-sicker-as-omicron-stalls-everything-from-heart-surgeries-to-cancer

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.npr.org%2Fsections%2Fhealth%2F2022%2F02%2F04%2F1078029696%2Famericans-get-sicker-as-omicron-stalls-everything-from-heart-surgeries-to-cancer&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Ca644499192fd4bc23a4408d9ea7f688b%7C11d0e2>

In my case, I have pain – sometimes debilitating pain – in my left shoulder and left hand. Doctors determined that I have a pinched nerve in my shoulder. A surgeon at Harborview Hospital (Seattle) determined that the first course of treatment should be physical therapy.

Thus, I was scheduled to see a physical therapist at Harborview starting on Monday, January 24. However, one of Harborview's staff called me the Friday before my appointment and told me, "We have to reschedule your appointment because we are swamped with COVID. The physical therapist has been moved to working with COVID patients. We can't get you in until March." A two-month delay in medical treatment because of unvaccinated COVID patients.

We all know that the VAST MAJORITY of COVID patients who require hospitalization are unvaccinated.

Therefore, given that COVID vaccinations are widely available in the United States..... the only reason that our hospitals are overwhelmed and having to delay necessary medical care of various types to vaccinated patients (from cancer surgeries to joint replacements to physical therapy is because of COVID patients who have CHOSEN NOT TO GET VACCINATED. THIS IS AN APPLES-TO-APPLES COMPARISON TO GIVING LIVER TRANSPLANTS TO ALCOHOLICS WHO CONTINUE DRINKING WHILE DENYING LIVER TRANSPLANTS TO PEOPLE WHO AREN'T DRINKING ALCOHOLICALLY (see page one).

In my case, I am in too much pain to "sit around waiting" another two months for medical care – i.e., to receive physical therapy that would be covered by my health insurance. Therefore, I am experiencing financial hardship to now start paying out-of-pocket to go to a chiropractor for medical care for my pinched nerve (Apple Health doesn't cover chiropractors). I have been forced into economic hardship (paying out of pocket for a chiropractor – using a bank loan - when I can't afford to do so to get medical care because Harborview can't get me in to provide care that would be covered if I went to Harborview for physical therapy) as a direct result of hospitals providing COVID treatment to unvaccinated Washington residents (and Idaho residents?) at the expense of vaccinated Washington residents such as myself whose medical care is sometimes being delayed.

HOSPITALS SHOULD BE EXERCISING THE OPTION OF DENYING MEDICAL CARE TO UNVACCINATED COVID PATIENTS, PARTICULARLY WHEN THEIR COVID MEDICAL CARE IS JEOPARDIZING OTHER PATIENTS. SUCH UNVACCINATED PATIENTS CHOSE TO NEED

HOSPITALIZATION BY NOT GETTING VACCINATED AND HAVE THUS CHOSEN TO DELAY MEDICAL CARE PATIENTS FOR VACCINATED PATIENTS LIKE ME.

Were hospitals allowed to decide whether or not to provide medical care to unvaccinated COVID patients (hospitals still could provide such care if they wanted to and/or have the capacity to do so), then hospitals would be more able to provide medical care to vaccinated patients such as myself.

THEREFORE, until such time as you – the Washington State Board of Health – decide to give hospitals the OPTION of denying medical care to unvaccinated COVID patients, I am contacting you to be reimbursed for my medical expenses - \$300/to date; my out-of-pocket expenses are expended to reach \$600 - \$900. I look forward to and appreciate immediate reimbursement.

RE: Billing the Washington State Board of Health for Your Outcomes (or lack thereof)

A specific matter of public health policy surrounding COVID – or lack thereof – is resulting in myself and other Washington State residents being denied timely and efficient healthcare. This creates unnecessary anxiety, unnecessary pain and suffering, and – sometimes - negative health outcomes and/or financial distress. I am contacting you to have you correct this matter of public health policy.

CONTEXT: From both a public health perspective and an individual health perspective, the medical system has existing policies regarding certain medical transplants and joint replacements. Specifically:

- 1) I have a neighbor who needs a knee replacement. Medical providers refuse to do a knee replacement until my neighbor quits smoking. *She's being required to participate meaningfully in her own health outcomes.* She won't quit smoking, she is now hobbling around with mobility devices as a result of her unwillingness to stop smoking to receive a needed knee replacement.
- 2) A friend of mine also needs a knee replacement, but she is medically obese. Doctors told her that she needs to lose weight before they will do a knee replacement. She's already lost at least 30 pounds so that she can get a knee replacement.
- 3) When heavy drinkers (alcoholics, et. al) need a liver transplant, medical providers often require such individuals to achieve a period of sobriety before they become eligible for a liver transplant (six months sober or?). There aren't enough liver transplants available to meet public need, so it's in the interest of public health for liver transplant recipients to be in a position to have positive outcomes (i.e., quit drinking).

HOWEVER, THE SAME PRINCIPLES ARE NOT BEING APPLIED BY HEALTHCARE PROVIDERS AND/OR THE WASHINGTON STATE BOARD OF HEALTH TO THE COVID PANDEMIC. Unvaccinated COVID patients are being allowed to overwhelm our medical system to provide them with avoidable hospital care that could be avoided if such persons were held responsible for participating in their own medical care (i.e., requiring vaccinations for hospital admittance). As a result, myself and multiple other vaccinated Washington State residents who need non-COVID medical care through no fault of our own are being denied access to *timely* medical treatment because hospitals are swamped with unvaccinated COVID patients. See: <https://www.npr.org/sections/health-shots/2022/02/04/1078029696/americans-get-sicker-as-omicron-stalls-everything-from-heart-surgeries-to-cancer>

To whom it may concern,
Please vote NO on making covid 19 vaccine a requirement for children in school. There is not enough data on this vaccine in the first place and definitely not enough understanding of the side effects long term for children. Children who have a 99.98% chance of surviving covid 19. The vaccines do not stop transmission. If someone wants to protect themselves against covid 19 because they are older and are in a higher percentage of death or health issues from covid that is their choice to vaccinate themselves. To require vaccination for children is just irresponsible, there has not been enough time or trials to know how this will effect them.

With much concern,
Kelli Douglas

Good morning,

I am reaching out in response to the scheduled meeting for February 10th to discuss the Covid vaccine inclusion in WAC chapter 246-105. I oppose this and all vaccine mandates. As the vaccine has proven to be ineffective at preventing viral spread or infection within the state, and since children are the least at risk for severe disease, there is no public health benefit from mandating this vaccine. Doing so exposes children to unnecessary unknown risks, with negligible benefit.

A very concerned citizen,

Good evening,
As a parent of school age children in the state of Washington, I strongly encourage the TAG to vote against implementation of any COVID-19 vaccine requirements for school attendance. The science has shown there is minimal to no benefit of vaccination for children due to their inherent robust immune system.

Voting to include COVID-19 vaccine requirements will create a massive divide in our communities and lead to no actual health benefit.

Concerned parent,
Sean Lawler

Dear BOH:

Please share with your TAG committee:

Response to # 5-6 on your criteria:

Please be advised. I am a Washington State citizen, and a parent. The edicts coming down from Federal agencies are counter to the data they have collected. It is up to you to stand against this corruption that suits to assist profit, and not the health of our children.

From VAERS and VigiAccess reporting it is clear that children have a far higher likelihood of an adverse event from the vaccine than they do contracting Covid-19.

The money that comes from the top corporate structure through government agencies, that is then distributed to bureaucratic decision makers, breaks the intended mission of our health agencies to serve and protect the citizenry. Through this bribing scheme, corporate interest then have the mandate of government to purchase and distribute it's product at ZERO LIABILITY to themselves.

Stop this attempt to get children on a vaccine schedule that will insure no liability.

Stand firm. Stand up. Do you job.

Sincerely,

Jay Fratt

Subject: Support of Vaccines

External Email

Hello,

I am writing in support of requiring the covid-19 vaccine for children 5-11 in schools. As the owner of a private business that runs youth summer programs, having a required covid-19 vaccine for schools will help ensure the safety of all of our children. It will make programming easier to implement, lower absences, and provide a sense of security for families. We are going to be requiring proof of vaccination or a negative test for our summer camp, but having it as a statewide requirement will make it easier for us to manage the implementation of our policies. We polled our camp families and over 75% were in favor of a vaccination requirement. I know this is a hot-button topic and appreciate your thoughtful consideration.

Thanks,
Jessica

Please do not require children to take the Covid 'vaccine'. There are no long term studies on this genetic altering injection and since children are at such a low risk of poor outcomes should they get Covid it doesn't make sense for them to get the vaccine. Plus it should be their parent's decision if they get the vaccine.

To the TAG committee on school vaccines and the WA Board of Health:

Please consider that our children are at a very low risk of mortality from Covid-19. The chance of an adverse reaction is a higher risk. These Covid-19 vaccines have not undergone long-term phase 3 clinical trials and should not be required for any school age child. Myocarditis is a risk reported by the CDC. This is not a mild disease at best. Young people who previously had no comorbidities now cannot exercise for minimally six months and are put on several heart medications. The known outcome for myocarditis is not good. No one should be required or be coerced to get a vaccine that could do this harm and possibly do it long-term. Please bring in other doctors that can give the other side to this story. It is not wise to listen to only one side when it comes to scientific consensus. I urge you all to recommend a NO when it comes to school covid-19 vaccine requirements. Thank you. Laurie Buhler

Subject: Parent AGAINST mandating the covid vaccine for children

External Email

WAC 246-105-030

"A child is required to be vaccinated against, or show proof of acquired immunity for, the following vaccine-preventable diseases before attending school or a child care center..."

Many parents in the State of Washington are firmly against adding the current covid-19 vaccine to the list of required vaccination prior to school entry. My reasons for opposition are as follows:

1) The available covid vaccine for children (Pfizer's BNT162b2) is still under emergency use authorization (in addition, the only FDA approved covid vaccine is COMIRNATY, which is for ages 16+ and not readily available in the USA). No vaccine has ever been added to the list of required childhood vaccinations while under EUA.

2) Pfizer's phase 2/3 clinical trials for children ages 5-11 were underpowered, including only 1,518 children that received the vaccine prior to FDA review on October 26, 2021. These children (along with ~1,500 additional children in the expanded group) will be actively monitored in the years to come. However...

3) Passive surveillance is being utilized to monitor the larger population of children. The limitations of VAERS is well known and insufficient in order to demonstrate the safety of a vaccine.

4) Children are at minimal risk of serious covid complications. Healthy children have been found to have zero risk of death: "Children without comorbidities were found to be significantly less likely to suffer from a severe or fatal disease course. The lowest risk was observed in children aged 5-11 without comorbidities. In this group, the ICU admission rate was 0.2 per 10,000 and case fatality could not be calculated, due to an absence of cases." (<https://www.medrxiv.org/content/10.1101/2021.11.30.21267048v1> <<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.medrxiv.org%2Fcontent%2F>

5) The current covid vaccines do prevent infection or transmission of the virus and therefore Covid-19 is not currently a "vaccine-preventable disease".

6) The impact of vaccinating children that have already acquired natural immunity against Covid-19 is unknown.

7) The CDC has recently released an analysis of cases and hospitalizations by Covid-19 vaccination status and previous Covid-19 diagnosis. In the CDC's analysis, those with infection-based immunity fared as well or better than those with vaccine-based immunity. (<https://www.cdc.gov/mmwr/volumes/71/wr/mm7104e1.htm>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.cdc.gov%2Fmmwr%2Fvolumes/71/wr/mm7104e1.htm>

The decision to vaccinate a child against Covid-19 should be made by the child's

parents in consultation with the child's doctor. It is inappropriate for the State to mandate Covid vaccinations.

Thank you for you time and consideration.

Sincerely,
Leanna Pan
(mother to three young children in Seattle)

Subject: Data/studies for school testing and masking for children

External Email

To whom it may concern,

I'm writing out of frustration and a lack of understanding to what is happening in our schools to our children. We are requiring "test to stay" for children that may have been "exposed" even if those children being tested have ZERO symptoms. Have you watched young children being tested? As a father of three, two who attend public elementary, it is traumatizing to watch you child cry as a swab is placed their nose just for them to remain in school unless they quarantine for 10 days.

Why are we allowing this to be done to our children? Why are we enforcing this notion that our children are always "sick" instilling irrational fear in their lives. What is the science or data that unequivocally supports testing them due to a possible "exposure"? Can anyone answer that intelligently, purely with the science and data? I believe it really comes down to adults irrational fears and partisan politics being forced on our children.

Second, why are we masking our children in school? Can anyone provide me the data, studies, and science on masking children. Correct me if I'm wrong but the CDC, HHS, and others have admitted to cloth masks having no effect on transmission/spread and surgical masks having very limited effect. In fact most studies indicate the N95 isn't effective unless properly fitted, used, etc.

So again I ask what is the proven studies, data, and science behind masking our children? They have no idea what their teachers and classmates look like, they can't see the lip/mouth movement during instruction, and they constantly touch their masks getting who knows what germs inside. Why can adults attend events, go out to eat, etc maskless but we mask our children. Do you realize how absurd the policy makers look? A disease that largely doesn't effect children, who aren't majors vectors of transmission, being forced to wear something that is proven ineffective. Why are you so settled on looking back at this terrible decision/policy and being on the wrong side of history?

V/r,
Kerry

Included is a link to an article written by a doctor, Vinay Prasad, at UCLA. I ask that you read it, opinion piece or not, it has plenty of citations of data to back up the article.

Subject: vaccine mandate

External Email

I sent you an email last Friday but it was mostly relevant to mandates being imposed on the school age children of WA State. Today I learned that most of your discussion tomorrow is going to be on whether or not force adult citizens of WA State to take the vaccine. And if they don't, to be forced into internment camps until they do comply. This sounds like Nazi Germany, I never thought I would be hearing that my own government would even consider such a thing.

Over the last two years we have had to listen to the BLM cries of injustice done to them by a generation long past. We listened to 'My body, my choice' when it concerned abortions for unborn babies. But now, we adults seem to have no choices if it were to be left to the government - you know, the people we voted to put into office - to protect us, to work on our behalf. All I can do - all we can do - AT THIS TIME - is to present you with a few of the most important reasons why I and a majority of concerned citizens feel that you should do all you can to uphold our rights as human beings and United States Citizens.

1. Mandated vaccines are a direct interference with families by forcing medical treatment without consent, and are thereby a violation of Article 12 of The Universal Declaration of Human Rights.

2. Article 7 of the 1966 International Covenant on Civil and Political Rights as put forth by The Geneva Convention states: No one shall be subjected without his free consent to medical or scientific experimentation. Experimental vaccine ties it directly into the Nuremberg Code, which says that we cannot be experimented on [without consent]. We always have the right to accept or refuse a medical treatment.

3. The Universal Declaration of Human Rights, put forth by The United Nations, states:

Article 12: No one shall be subjected to arbitrary interference with his privacy, family,

[or] home. ... Everyone has the right to the protection of the law against such interference. Mandated vaccines are a direct interference with families by forcing medical treatment without consent, and are thereby a violation of Article 12 of The Universal Declaration of Human Rights.

Article 18: Everyone has the right to freedom of thought, conscience, and religion; this right includes freedom...either alone or in community with others and in public or private, to manifest his religion or belief in teaching, practice, worship, and observance. Similar to The First Amendment of The US Constitution, any law that denies parents a vaccine exemption for religious reasons is a violation of the protected right of Americans to freely exercise their religious beliefs as they see fit for themselves and their family. Denying a philosophical exemption is also a violation of personal beliefs and philosophy as described by Article 18. In addition, any law mandating vaccines that calls for the quarantine or banishment of "the unvaccinated" from a public space, such as a school or market, simply for exercising their right to practice their religious or personal beliefs through use of a vaccine exemption is a violation of Article 18.

4. Mandated vaccination is a violation of medical ethics. The Hippocratic Oath states: (Traditional translation) Traditional translation: I will keep them [patients] from harm and injustice. I will neither give a deadly drug to anybody who asked for it, nor will I make a suggestion to this effect.

5. The American Medical Association's Code of Medical Ethics states: Informed Consent: The patient should make his or her own determination about treatment. ... Informed consent is a basic policy in both ethics and law that physicians must honor, unless the patient is unconscious or otherwise incapable of consenting, and harm from failure to treat is imminent. The AMA's Code of Medical Ethics specifically states that physicians must honor the patient's wishes regarding their treatment; it is not optional.

6. There is no imminent, impending, or otherwise immediate threat of bodily harm that would result from declining vaccination. The true bodily harm has been shown to come to those who have gotten the Covid Vaccine and boosters. And without imminent danger to others, there is no legitimate reason for EUA (Emergency Use Authorization) of any of the Covid vaccines. So you must ask, what then are the reasons - when the FACTS are out there - the vaccines are eminently more dangerous and lethal than any of the Corona Virus variants.

Four standards that must be fulfilled for an EUA. If any of these criteria are not met, EUA cannot be granted or maintained.

(a) First, the secretary of Health and Human Services has to declare and maintain a state of emergency. If the emergency were to go away, all EUA products would have to come off the market. And that doesn't just mean vaccines. It also includes the PCR tests and even surgical masks.

(b) The second standard is evidence of effectiveness. Historically, vaccines had to show a

70% or greater effectiveness, as measured by a fourfold increase in antibody levels, in order to qualify. For an EUA vaccine, the efficacy threshold is only 30% to 50%. In another departure from prior vaccine approvals, the COVID vaccine clinical trials relied on the RT-PCR test, not antibodies, to demonstrate effectiveness in the small "challenge phase" of the trials. (Now, you probably heard that the Pfizer shot was 95% effective when it first rolled out, but that was 'relative risk reduction', not 'absolute risk reduction'. Confounding these two parameters is a common strategy used to make a product sound far better than it actually is. The absolute risk reduction for Pfizer's shot was just 0.84%.³ (For ex: if a study divided people into two groups of 1,000 and two people in the group who didn't get a fictional vaccine got infected, while only one in the vaccinated group got infected, the relative risk reduction would be reported as 100%. In terms of absolute risk reduction, the fictional vaccine only prevented 1 in 1,000 from getting the infection - a very poor absolute risk reduction.)

(c) The third standard is that the known and potential benefits of the product must outweigh the known and potential risks of the product. In the case of COVID shots, there's overwhelming evidence showing they do more harm than good.

(d) The fourth and last standard that must be met is there can be no adequate, approved and available alternative treatments (drugs or vaccines). "This is why hydroxychloroquine and ivermectin were quashed," Mayer says. This is also another reason Comirnaty is not treated as a fully approved product in the U.S., because if it were, then all the other COVID shots that are under EUA would have to be removed from the market.

7. Mandated vaccination is a violation of legal accountability and medical science. we object to being denied our right to decline a medical procedure or product in which: The manufacturer cannot be held liable for any injury or death occurring from the use of their product (The National Childhood Vaccine Act of 1986) ----- The government recognizes that the product and procedure is "unavoidably unsafe" (US Supreme Court ruling, 2011) The manufacturer admits in the package inserts that the product: 1.Has not been tested for carcinogenic or mutagenic potential 2. Has not been tested for safety in the populations targeted for product use 3. Can cause serious permanent injury and death 4. Can cause the very illness and disease the product is designed to prevent.

Product safety and efficiency studies are funded and conducted by the product manufacturer and/or the federal government instead of by an independent and neutral third-party which has no stake in potential profits from product sales.

The product: 1. Has been "fast-tracked" for approval without undergoing basic safety and efficiency studies (HPV vaccines) 2. Has not undergone proper randomized, double-blind, placebo-controlled safety and efficiency studies 3. Has not undergone long-term safety and efficiency studies. The manufacturer is facing multiple federal charges of scientific fraud in regards to product efficiency (Merck's MMR vaccine)The Centers for Disease Control and Prevention (CDC) is facing allegations of scientific fraud in regards to product safety (Merck's MMR vaccine)

To whom it may concern:

I have seen in the media that the Washington State Board of Health is considering making the emergency use of a experimental vaccine mandatory for school children.

This so called "vaccine" should not be made mandatory for school children.

More children have died from the vaccine than from Covid-19.

More children have died from suicides due to lock-downs than from Covid-19.

This vaccine is toxic to humans. It doesn't take much research to see the damage to individuals that have taken the vaccine especially to young males.

The survival rate for children that catch Covid-19 is above 99.8% There is more risk in children in taking the vaccine than catching the virus.

Please don't consider the Covid-19 vaccine for school age children.

Extremely concerned that you are having a conversation to add this to the WAC. The last meeting was that you were tabling this until you had more information about it and allow the people to weigh in. Covid vaccine is no different than the Flu vaccine and should be treated the same. Flu vaccine is not required and neither should Covid vaccine. I know several more people that were vaccinated who had and spread Covid to others including the unvaccinated! I also know personally that unvaccinated did not have to go to the hospital or treatment, they were not as sick as the media portrays. I know many parents that will remove their kids from public schools if you put this in the WAC to require the vaccine. We need to stop creating segregation of the people!!!

Subject: Do not make it mandatory

External Email

Do not make it mandatory for the COVID-19 shot for entry into the schools, daycares, etc., for our children.

You are a small group of people making decisions on thousands of children. Therefore, more and more parents are opting out of all shots together.

And the comment that was made about "parents being scared to send their children to the public pools" regarding Polio. What really was happening is that the pools were being sprayed with a chemical to fight the mosquitoes and when people came in contact with it - it caused Poliovirus symptoms.

I know many young parents that are opting out of all vaccines because of this one shot that is the hot topic.

They are doing their research and learning what they have done to their children and they regret following the protocol of the shots given to their children.
For example: most did not know they were given their children a vaccine for the chicken pox. They are learning and opting out since they as parents have had the chicken pox.

Please do the right thing to gain trust back with the young parents.

Thank you

Subject: Re: Health survey for requiring COVID vaccine for students

[EXTERNAL Email Notice!] External communication is important to us. Be cautious of phishing attempts. Do not click or open suspicious links or attachments.

To add to my previous email:

The Pfizer vaccine for kids under 5 years old fails on at least three of the four criteria above.

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fcmq5z04.na1.hubspotlinks.com%
TN7PgQ0X5nKv5V3Zsc37CgTTgW6CbT231GDvFYW1TkKH22_vvVqN9fdIYD2-
j_IW4GDhGt2TmWy6W83DCTx1nv2-

are “with Covid” rather than “for Covid.” This means that the child was hospitalized for another condition, injury, or infection, but tested positive for Covid on admission. Thus, the risk of Covid in kids this age doesn’t qualify as an emergency, and the first criterion hasn’t been satisfied.

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fcmq5z04.na1.hubspotlinks.com%
TN7PgQ2J3q90JV1-

W2pV8yK5vSf3S3jYj1&data=04%7C01%7Cwsboh%40sbh.wa.gov%7C0a6938f3019d4db2c05a08d9e7423

Third, we don't know enough about the potential risks of the Pfizer mRNA vaccine in kids under 5 years of age. Pfizer claimed that "no safety concerns were identified" in their initial trial, but the number of participants was small—they initially enrolled 4,500 young kids, but it's not clear how many actually participated in the trial.

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fcmq5z04.na1.hubspotlinks.com%
TN7PgO0X5nKv5V3Zsc37CgWvJTzc7x7v8gmIW4pjnCw3HYtJzW60vj5q8sR5RLW6cyN4L3XCQx W7hMz4-

m77pQ6n3k0k1&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C0a6938f3019d4db2c05a08d9e742391f% from the Centers for Disease Control and Prevention (CDC) suggesting that the risk of an adverse effect from the Covid vaccines in 5- to 11-year-olds may be as high as 1 in 1,104. If the risk of an adverse event is even close to this in kids under 5 years old, it doesn't make any sense to approve a vaccine in this age group when we have absolutely no evidence of benefit. Thus, the third criterion hasn't been satisfied.

Nevertheless, Pfizer has submitted an EUA application, and the FDA will review it on February 15. I cannot for the life of me understand how the FDA can review an EUA application when there are no data on the vaccine's efficacy to support the application!

This is incredibly disturbing. The FDA seems to be rushing to approve a completely

forced mandate on a broad scale.

I strongly reject the idea of a vaccine mandate for school age children in the state of Washington. I live Bothell and my 7 year old attends the North Shore School District. With weekly testing the North Shore District has not had any major outbreaks. With weekly testing and proper remote school technology options in place, there is no need to risk kids life from having irreparable side effects.

I have been suffering from an adverse Pfizer vaccine reaction that has completely impacted my quality of life. I had no prior medical issues and now have daily neurological symptoms for which I am seeing 5 different doctors from neurologists, to immunologists, to holistic specialists for detox and 6 months later, I still have no relief after spending tens of thousands of dollars. I have reported it to VAERS, CDC and Pfizer and no one cares to help those injured from the vaccine.

I am not alone, there have been over 1MM adverse reactions reported to VAERs in the US alone. So many other countries are doing away with mandates and many colleges in the US have done so already.

If you enforce this mandate, you will thousands of parents pull the kids out from public schools which will greatly reduce you funding.

Please take this into have a proper survey via a proper survey tool to capture proper feedback.

Thank you for your consideration.

Jennifer Lazo

Attn: TAG group studying school vaccine recommendation regarding COVID

Please read the original message below and view the presentation at the link provided.

It's specifically qualified author discusses extreme variability of adverse effects to the anti-COVID injection when evaluated by lot number. This indicates "adulterated product" which should not be administered to anyone, and particularly not children.

Subject: Jan 12 meeting comment - VAERS analysis

VAERS analysis of COVID vaccines by lot show EXPONENTIAL variability of event counts compared to flu vaccine history.

Primary discussion of this starts at 40 minutes into the video linked below. Particularly see discussion and graphs starting at the 45 minute to one hour time-period.

Couple this with indications that medical facilities are increasingly directing personnel to not report incidents to VAERS, which would reduce counts for more recent batches.

Presenter is Dr. Mike Yeadon, former vice-president of respiratory research for Pfizer.

External Email

Dear Ms. Haag,

Thanks for holding a great Technical Advisory Group meeting on 1/12/2022.

After the meeting, I notice SBOH put out a survey at:

[https://forms.office.com/Pages/ResponsePage.aspx?id=F-](https://forms.office.com/Pages/ResponsePage.aspx?id=F-LQEU4mCkCLOffcwSfXLT2Pur8KuHhPgr4pnygk7IxUQklaTUhYTVBXNUdJOTQ3TFpQRlpCOUdCRC4u)

[LQEU4mCkCLOffcwSfXLT2Pur8KuHhPgr4pnygk7IxUQklaTUhYTVBXNUdJOTQ3TFpQRlpCOUdCRC4u](https://forms.office.com/Pages/ResponsePage.aspx?id=F-LQEU4mCkCLOffcwSfXLT2Pur8KuHhPgr4pnygk7IxUQklaTUhYTVBXNUdJOTQ3TFpQRlpCOUdCRC4u)

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fforms.office.com%2FPages%2FReLQEU4mCkCLOffcwSfXLT2Pur8KuHhPgr4pnygk7IxUQklaTUhYTVBXNUdJOTQ3TFpQRlpCOUdCRC4u&data=04>>

in an effort to continue collecting public comments, which is also great.

However, it has come to my attention that a Chinese anti-vaxxer has been organizing a flooding of fake data against the survey in an effort to mislead the health opinions of the general public to try to influence the public policy maker.

This person's online Telegram name is: □□□□, and he is agitating all his 12.2k followers all around the world to storm this survey with anti-vaxxing responses in order to cause WA BOH to make ill-formed decisions.

According to the published public comments, I notice this person also sent several emails

1/21 In the evil state of Washington, last week, the Board of Health failed to include "Use law enforcement to detain the unvaccinated" and "vaccination mandate in school" in their

agenda. But they would not accept their failure. They know there are all kinds of left-wing White, Black, Yellow, Spanish here, so they put out an online survey, in an effort to support their "adding COVID-19 vaccine as a requirement for school entry" proposal.

NO MATTER WHERE YOU ARE, I want you to help me fill this out which can be done in just 1 minute. Your small effort will help me bring debacle to these evil fake health officials' attempt to harm my children. Join us, let your voice be your weapon.

As far as the first question is concerned, just use "Washington School District".

Obviously, he is encouraging 12k people, many of whom are not even living in the US, let alone WA state residents, to flood the survey with faked WA residents data, which obviously pose a serious threat to the public health of the community and commit a crime. In the screenshot, you can also see he is openly asking people (including non-US citizens) to submit the survey more than once and in vulgar languages.

In particular, his agitation scheme to sway health official opinions could result in tremendous health risk consequences to the millions of children in Washington state.

Please ask the appropriate department to step in, investigate and defeat this egregious cyber attack! At the minimum, denounce such fraud in your next public meeting with this evidence.

Thanks to you for keeping the Washington state communities and children healthy!

Jennifer

<bill@teachingsmiles.com> wrote:

Dear Washington State Board of Health, Keith Grellener, Tom Pendergrass, Elisabeth Crawford, Temple Lentz, Vazaskia Crockerell, Fran Bessermin, Bob Lutz, and Umair Shah,

The Legislature has asked the Board of Health for advice on HB 1684 Fluoridation to be provided within 10 days. Ten days is not enough time for the smartest person in the world to carefully review all streams of evidence on all sides. Tradition supports fluoridation. Please consider science rather than endorsements.

The US Food and Drug Administration and the Washington State Board of Pharmacy, all Pharmacopeias and most developed countries have determined fluoride when marketed for ingestion with the intent to prevent dental caries is a legend (prescription) drug.

The research is clearly showing too many (70%) of children have dental fluorosis, a biomarker of excess fluoride exposure.

The research is clearly showing mothers on fluoridated water and infants ingesting fluoridated water used to make their formula result in developmental neurotoxicity (lower IQ). In the last 4 years, 22 human studies report lower IQ. Grandjean et al 2021 reported 5 IQ loss with mother's urinary fluoride concentration at 0.7 ppm. Urine fluoride concentration mirrors the fluoride concentration of water the mothers and infants are ingesting and a Benchmark Dose for only 1 IQ loss is 0.2 ppm.

HB 1684 is built on historic tradition without looking at the current science. Dental caries are not highly contagious or lethal like COVID and fluoride ingestion should not be mandated when so many are showing signs of excess fluoride. Makes no sense to give those with too much fluoride even more.

Fluoride is now considered as lethal to the developing brain as lead. Although HB 1684 does not mandate fluoridation, it pressures more water purveyors to fluoridate their water.

Proponents have never answered the most fundamental question of how the fluoride gets from the blood in the tooth to the surface of the tooth where caries start or have started.

No known mechanism for fluoride transfer through the tooth is known. Researchers are now reporting swallowing fluoride has little chance of reducing dental caries. No metabolic function requires fluoride. Fluoride is not a nutrient.

Proponents rely on endorsements, tradition and one side of the science. Please review the attached for more evidence. The Board has a great deal of historical evidence from previous submissions.

Please advise the Legislature to not pass HB 1684 until a more thorough and careful review of the science can be achieved.

Sincerely,

Bill Osmunson DDS MPH

Subject: Comments for the Immunizations Technical Advisory Group

External Email

CDC released data demonstrated natural immunity was 2.8 times as effective in preventing hospitalization and 3.3 to 4.7 times as effective in preventing COVID infection compared with vaccination.

COVID survivors should not be required to be vaccinated. Their previous infection provides significant protection for themselves and the community.

Children are not a threat to other people and the infection is rarely dangerous for kids. Children should not be required to be vaccinated against COVID. The risk of vaccination outweighs the benefits.

To The Washington State Board of Health and the Public It Serves::

We the free and united people of America and the world are writing in regards to the unlawful and corrupt actions taken by the healthcare industry, bureaucrats, and media regarding COVID-19. The actions taken for nearly two years now have stripped people of their rights, decimated the US Constitution, violated the principles of international law embodied in the Nuremburg Code, and ignored basic and inalienable human rights. The people behind this have leveraged their privileged positions to make billions of dollars at the expense of humanity and we are unwilling to allow this to continue.

For decades, the field of public health has researched the use of fear as a tool to manipulate people into action. The use of that tool has now been perfected and implemented against the people of the world with COVID-19. Evidence of this knowledge can be found in a CDC presentation, other DHHS materials, and in numerous academic journals. The intentional use of fear to sow hate, division, and discord is unethical, unacceptable, and must stop immediately. The reality is that COVID-19 has a 99%+ recovery rate in most of the population and approximately a 94% recovery rate in the most vulnerable. Compare this to the original SARS which had approximately a 9% case fatality rate and the original MERS which had over a 30% case fatality rate. We did not lockdown, mask, or even widely acknowledge these diseases when they were prevalent despite the fact that they had similar rates of spread to COVID-19. This fear has been used as a marketing tool to attempt to justify previously unthinkable actions by bureaucrats and public health figures around the world; the most egregious of which is the forced injection of gene therapy drugs into healthy people. Gene therapy literally alters the 1 genetic makeup of a human being and simply cannot legally, morally, or ethically be forced on anyone, ever. If the decision to alter one's own genetic makeup does not rest with the individual then there can be no argument that freedom is lost. Not only are the COVID "vaccines" admittedly a gene therapy, they are inarguably unsafe.

The swine flu vaccine was pulled from the market after just over 20 deaths, the Chevy Volt was recently recalled over the potential for battery fires, but the Pfizer shot was given expanded authorization despite the high recovery rate from COVID-19 and the fact that Pfizer's own documents, submitted to the DHHS show that over 1200 people died in less than the first 3 months of authorization. This is nothing more than corruption. The COVID shots are also ineffective. A recent Department of Defense document stated that 71% of new cases of COVID-19 in the Medicare population are in fully vaccinated individuals and 60% of hospitalizations are in the fully vaccinated. This same document also stated that the injections are even less effective in North American Natives, Hispanics, and "Blacks" (the document apparently was unconcerned with political correctness).

If the 1 Moderna acknowledged in SEC filings that mRNA technology is a gene therapy. This has also been acknowledged in documents from Pfizer and by numerous scientists. "vaccines" do not stop the spread, do not stop hospitalization, alter our genes, and have not even existed long enough for long term testing, why are we attempting to violate people's inalienable rights by forcing them? The fact is that we are now moving ahead as quickly as possible with these COVID shots. We are even authorizing them in children despite the fact that people under 30 are at ZERO statistical risk of death from COVID-19

and the shots appear far more dangerous to children than the disease. Further, we are doing this with no transparency. The DHHS has done everything possible to cover up the side effects and dangers of these injections, even going so far as to request 55 years to release the documents they relied upon to authorize/approve these deadly injections.

How can informed consent be given without a true understanding of the risk? This situation is untenable and we demand that it be remedied. We the free people of this nation and world will no longer comply with mandates that fail to consider our inalienable rights. In the spirit of Martin Luther King, Gandhi, and Jesus Christ we will spread our message through peace and we will resist peacefully, but make no mistake, we WILL resist.

The accompanying presentation found at www.renz-law.com

<<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fwww.renz-law.com%2F&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Cb076036d6c184754389008d9e90b5155%7C>

supplies you with additional data to demonstrate everything stated here. We now demand the following from our elected leaders, and vow to remember your actions or inaction when it comes time to vote and donate:

1. The resignation/termination of Anthony Fauci and civil/criminal investigation of his actions by a truly INDEPENDENT prosecutor;
2. The criminal and civil investigation of those involved with any gain of function research that may have been responsible for the creation of SARs-COV2;
3. Investigations – criminal and civil – into the deceptive and misleading push for the gene therapy injections that have been falsely labeled as vaccines (only after the definition of “vaccine” was changed); a. This should include RICO and fraud claims (as is appropriate) involving the “Trusted News Initiative”, the drug companies, hospital systems, and some government actors;
4. Transparency legislation that gives the public immediate access to the raw data and submitted documents related to the shots and COVID “pandemic” – If there is nothing to hide NO ONE should oppose transparency; a. This should be passed on the state level as well;
5. Liability for injury from vaccines under the same rules as any other product – if they are safe there should be no opposition to liability to help those that have been injured;
6. Legislation that recognizes the absolute right to reject medical treatment or vaccination of any type for ANY reason;
7. NO funding or state/federal contracts with ANY organization that discriminates based on vaccination or health status;
8. Funding for the hundreds of thousands of individuals injured by job loss and “vaccine” injury;
9. NO on vaccination status tracking legislation; and
10. Our local law enforcement to uphold their oaths to uphold the Constitution and refuse to enforce unconstitutional mandates and rules.

Dear all:

This email is to promote two research projects.

Project # 1. From a colleague who is studying how prior music learning experience relates to learning with multimedia resources in non-music disciplines.

"The purpose of this study is to investigate how prior music learning experience relates to learning with multimedia resources in non-music disciplines. It will investigate whether cognitive strategies trained via music learning transfer to a non-music discipline by uncovering the association, or the lack thereof, that varying degrees of prior music learning, types of the music learning experience, and multimedia learning resource types associate with student learning performance. To be a participant, the individual should be 18 years old or older, with or without prior musical training experience.

Please use the link to participate and share the recruitment letter (attached) with your colleagues and/or students.

https://duq.az1.qualtrics.com/jfe/form/SV_aazmtz0OqqIfzBc
<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fduq.az1.qualtrics.com%2Fjfe%2F>
"

I took me 10-15 minutes to complete the survey. Thanks for helping this colleague.

Project # 2: Eastern redbuds are iconic spring bloomers, but mystery remains about the timing of their flowering

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.google.com%2Fsearch%3Fq%3Dmg%3A1600108931931%26source%3Dlnms%26tbm%3Disch%26sa%3DX%26ved%3D2ahUKewiIh_Wjpu
and fruiting

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.google.com%2Fsearch%3Fq%3CcCegQIABAA%26oq%3D%2522cercis%2Bcanadensis%2522%2Bseed%2Bpods%26gs_lcp%3DCgNpbWcQA
. The Redbud Phenology Project

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.usanpn.org%2Fnn%2Fredbud>
seeks to answer questions such as:

1. Does the timing of redbud flowering vary by location or elevation?
2. Is there a cycle to abundant years of redbud fruiting?
3. Are redbuds flowering and fruiting earlier in the year?

By signing up as a Nature's Notebook observer and tracking the seasonal activity of an eastern redbud tree where you live, you will collect important information to help scientists answer these questions!

Want to find out what's involved? Watch a recording of our virtual info session and training where we explain the significance of this project, walk you through the steps of creating a Nature's Notebook account and registering a redbud tree, and describe how to make observations and submit them online. Watch the video

2.

Please enter your comments or questions in the space provided below:

In response to the Washington State Board of Health's decision to convene a Technical Advisory Group for the purpose of considering Covid-19 immunization in Washington's immunization rule: <https://sboh.wa.gov/News/Articles/ID/3059/Technical-Advisory-Group-TAG-to-Consider-COVID-19-for-Inclusion-in-Washingtons-Immunization-Rule> <<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fsboh.wa.gov%2FNews%2FArticles%2FID%2F3059%2FTechnical-Advisory-Group-TAG-to-Consider-COVID-19-for-Inclusion-in-Washingtons-Immunization-Rule&data=04%7C01%7CWSBOH%40SBOH.WA.GOV%7Cf617b82e14064d04aa5f08d9e67b7ff8%7C11d0e>>
For personal, philosophical, and religious reasons my wife and I are adamantly opposed to any authoritative decision that does not support one's personal decision to abstain from the Covid-19 vaccination. If the State moves forward with this requirement and does not allow for an exemption including a reasonable accommodation for our children, they will be withdrawn from the Cascade School District in Leavenworth, the public school that they are currently enrolled in. Thank you for your consideration, David and Molli Ragsdale Leavenworth, WA

2.

Please enter your comments or questions in the space provided below:

I want to express my concern regarding a vaccine mandate for children. Both my husband I are vaccinated and we believe in vaccines. My child is fully up to date on her vaccines. We are not "anti-vaxers" but this vaccine is not at all necessary for young children. They are not at high risk for any serious complications with Covid. I'm much more worried about the long term and unknown effects of the vaccine on children which we couldn't possibly know about yet. Forcing children to get this vaccine is completely wrong and goes against our rights as parents and citizens of the United States. So many people feel this way. It is completely ridiculous to mandate this. You must think very seriously and weigh the implications of such a dangerous decision.

Regarding the WA DOH parent survey extended for the purpose of evaluating parent response to COVID 19 vaccination requirements for school attendance in WA state - initially, the survey would not allow submission of response. I would like to submit a more indepth response to this invitation, regardless.

Please take a few minutes to carefully consider the following information prior to voting to require children to receive this vaccination in mass numbers across our state. The information referenced, is completely aside from 'the right to choose' element, equally important and warranting consideration.

Risks:

There are numerous published medical or scientific studies on the Journal of the American Heart Association's website (to name just one), which outline cases of myocarditis and other medical heart issues post COVID-19 vaccination. To note a few (bold emphasis mine) -

1. In-Depth Evaluation of a Case of Presumed Myocarditis After the Second Dose of COVID-19 mRNA Vaccine, concludes with, "Additional surveillance of such adverse events after COVID-19 vaccination will help to identify whether there are subgroups who are at higher risk for this vaccine-related effect" (Vol 144, No 6) -

<https://www.ahajournals.org/doi/10.1161/CIRCULATIONAHA.121.056038>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.ahajournals.org%2Fdoi%2F10.1161/CIRCULATIONAHA.121.056038>>

2. Another published study: Clinically Suspected Myocarditis Temporally Related to COVID-19 Vaccination in Adolescents and Young Adults, concludes with, "Future studies should evaluate risk factors, mechanisms, and long-term outcomes" -

<https://www.ahajournals.org/doi/10.1161/CIRCULATIONAHA.121.056583>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.ahajournals.org%2Fdoi%2F10.1161/CIRCULATIONAHA.121.056583>>

3. Abstract 11847 Acute Myocarditis Following COVID-19 mRNA Vaccination, concludes with, "...warrants further description and investigation." -

https://www.ahajournals.org/doi/10.1161/circ.144.suppl_1.11847

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.ahajournals.org%2Fdoi%2F10.1161/circ.144.suppl_1.11847>

4. Myocarditis After BNT162b2 and mRNA-1273 Vaccination, concludes with, "providers should be vigilant for myocarditis after COVID-19 mRNA vaccination, and further research is required to understand the long-term cardiovascular risks." -

<https://www.ahajournals.org/doi/10.1161/CIRCULATIONAHA.121.055913>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.ahajournals.org%2Fdoi%2F10.1161/CIRCULATIONAHA.121.055913>>

5. Initial publication Abstract 10712 Mrna COVID Vaccines Dramatically Increase Endothelial Inflammatory Markers and ACS Risk as Measured by the PULS Cardiac Test: a Warning, stated, "We conclude that the mRNA vacs dramatically increase inflammation on the endothelium and T cell infiltration of cardiac muscle and may account for the observations of increased thrombosis, cardiomyopathy, and other vascular events following vaccination" before wording of the publication appeared to be carefully modified as documented.

The CDC itself recently published, "By early October, persons who survived a previous infection had lower case rates than persons who were vaccinated alone." -

<https://www.cdc.gov/mmwr/volumes/71/wr/mm7104e1.htm>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.cdc.gov%2Fmmwr%2Fvolumes%2F71%2Fwr%2Fmm7104e1.htm>

CDC also states: What is already known about this topic? An elevated risk for myocarditis among mRNA COVID-19 vaccines has been observed, particularly in males aged 12–29 years." - <https://www.cdc.gov/mmwr/volumes/70/wr/mm7027e2.htm>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.cdc.gov%2Fmmwr%2Fvolumes%2F70%2Fwr%2Fmm7027e2.htm>

, concluding with, "CDC and FDA will continue to closely monitor reports of myocarditis after receipt of the mRNA COVID-19 vaccines and will bring any additional data to ACIP for consideration. The benefit-risk analysis can be updated as needed to reflect changes in the COVID-19 pandemic and additional information on the risk for and outcomes of myocarditis after COVID-19 vaccination. The ACIP recommendation for use of mRNA COVID-19 vaccines under an EUA is interim and will be updated as additional information becomes available."

From a Google search results page: Transmission of SARS-CoV-2 in K-12 Schools - CDC

https://www.cdc.gov/coronavirus/2019-ncov/science/science-briefs/transmission_k_12_schools.html

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.cdc.gov%2Fcoronavirus%2F2019-ncov%2Fscience%2Fscience-briefs%2Ftransmission_k_12_schools.html&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Cb6d8ad96af60

briefs%2Ftransmission_k_12_schools.html&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Cb6d8ad96af60

Children are less likely to develop severe illness or die from COVID-19. ...

(although it appears this statement has since been removed from the page itself, even though Google picked it up as part of the page on search,).

If nothing else, all of this data clearly magnifies the fact that these vaccinations are still in trial and error mode, and still being studied for effectiveness and injuries. Given this, to require our children to be recipients of this, without any government or vaccine manufacturer liability, is negligent and should be considered criminal.

I am hopeful you will leave this decision to individuals and the parents of the children.

Thank you for your time and consideration,
Jennifer Farmin, concerned citizen and parent

Hello All,
This communication is to be forwarded to Jay Inslee by the Lieutenant Governor. This is because Inslee refuses to have an email address. Thanks in advance.

As you all may be aware, the world is now fully aware of what you are doing. Why is not VAERS numbers part of your agenda and daily narrative? Currently VAERS is reporting over 22,000 deaths and over 1 million injuries from the needle poison that you people are still pushing. Seriously ... how many people must die before you stop your campaign of murder and genocide. Yes ... murder. Are you all living under a rock? The world is full of doctors, nurses, experts and now politicians who are using the term "murder" their word not mine.

Not one of you can prove that an emergency is valid. Not one of you can prove the covid virus exists or any of the variants. You are acting criminally by using a fraudulent PCR test that the CDC has admitted cannot decipher between the flu and covid.

You all need to cease and desist your genocidal campaign of poking people with needle poison, that you incorrectly label a vaccine. Your campaign needs to stop NOW until the VAERS numbers have been investigated and verified.

The world is now aware of what you are doing. Please watch the attached videos. And please stop with your lies and propaganda. It is disgusting! Oh and please stop using the "cases" narrative ... the gig is up.

We are watching your department consider the mandate for all children to attend school.

This is extremely reckless, does not include the science and is very premature considering the effects of the vaccines have not been concluded.

To act on this before results and effects are in amounts to experiments on children.

What's wrong with you?

NO MANDATES FOR CHILDREN!

Wait until the study is finished and results are in and published. There are too many bad side effects showing up!

I am writing to you today in opposition to the Covid vaccine for children.

There is not nearly enough data to show its safety....in fact there is more data and proof coming out daily of its deadly side effects.

I will not ever give permission for my children to receive the vaccine. I pulled my kids already from public school....and my guess is you will see a mass exodus from Thousands more if you make it a requirement for attendance.

We do not coparent with the State or You! My child, my choice.

Dear board of health ,

I am asking and begging u to leave our children out of this concerning covid vaccine requirements for schools. This is going way to far and this needs to be a choice from a parent and not government ! You people need to wake up! This is evil and completely out of order. I am begging u to stop ☐ please take an inventory of your own soul ... is this really about money ???!!! Wake up

Subject: Adding covid vaccine

External Email

To whom it may concern,

It is deeply disturbing that you would consider adding the covid injection to the k-12 schedule. As you are aware this is an experimental injection, not an approved vaccine. The long term and short term effects are unknown. The fact that it is experimental, not approved, and with no long term or controlled studies should negate the call to implement this as required for anyone, especially school children. The data has shown that kids are mildly if affected at all, there is no reason to make a blanket approach for a non problem.

Parents are already questioning vaccines themselves, and especially the necessity for one for covid. Many parents are questioning allowing their children to go to or remain in the public school system. Trying to require additional, experimental injection will have a negative impact on enrollment and students. No parent should be forced to injection their child against their beliefs or wishes.

It is negligent on your part to not include persons whom would make a balanced panel or group to discuss this issue. When you have no one representing a dissenting voice you are merely prepertrating a scam of a hearing. If enrollment is an issue now, keep pushing parents to make ethical, moral, or spiritual medical decisions for their child to attend school, and it will only get worse.

Thank you,
Kala McGlashan

Hi Kaitlyn,

I am writing this email regarding the potential Washington state vaccine mandate for schools. Without going into great scientific debate, there is no discernment between vaccinated and unvaccinated people regarding contracting Covid or transmitting Covid. The Covid vaccines are not effective. The vaccines are actually not true vaccines by definition.

The second fact is that mandating experimental drugs on the general public is a violation of our constitutional rights living in the United States. Now our state is looking to mandate this on children in whom these drugs are not studied or approved. Comirnaty as a brand name is actually not being dispensed in the US at this time. We continue to use emergency stock piles of Pfizer's drug as well as Moderna which is not FDA approved, yet "counts" if you want to be considered vaccinated! No approval and not enough evidence for approval. The practice of distributing drugs not approved is illegal by so many laws we don't have time to discuss. No other vaccine to date has performed like this.

I am adamantly opposed any mandate for the Covid vaccine regardless of which one. We have a right to chose what goes in our bodies and how we manage the health of our children. This mandate for vaccinations for kids to be in school will cause parents to remove their children from this school system as well as physically moving from this state. Highly educated well paid taxpayers are leaving the state of Washington in droves because of Jay Inslees mandates and rules. This will be the final straw for thousands of people because we are NOT willing to be the experiment for Inslees political agenda.

I am happy to expand on the scientific data and information if you would like more information.

Thank you for you time.

External Email

Dear TAG members,

Please refer to your own materials stating that is no published literature on the covid vaccine efficacy in the school setting. How can you attempt to even consider adding this injection to the school-entry immunization schedule?

I think suicide and mental health issues should be much higher of concern to you. Our state government has literally killed more teenagers through suicide because of covid mandates than they have through any flaw in covid precautions.

End your deliberation and listen to the parents.

Respectfully, Courtney

The Right to Informed Consent is Meaningless Without the Right to Refuse Any Medical Intervention, Including Mandated Vaccination. Government Agents and those Acting Under Color of Law are Forbidden by Long-Standing National and International Law from Coercing Vaccination. Furthermore, this includes mask mandates and PCR testing. Children under the age of eighteen years of age need a parent's signature on any and all documents that deal with medical testing and this includes PCR testing in school.

On Tue, Jan 25, 2022 at 9:34 AM Me Zee <mzee636@gmail.com> <mailto:mzee636@gmail.com> > wrote:

The oath you took to uphold the laws includes these laws.

Requirements for vaccinations should never include an experimental gene altering injection.

We now know that these COVID injections do a great deal of harm to children.
Can you live with that on your conscience?

18 USC 241: Conspiracy against rights:

If two or more persons conspire to injure, oppress, threaten, or intimidate any person in any State, Territory, Commonwealth, Possession, or District in the free exercise or enjoyment of any right or privilege secured to him by the Constitution or laws of the United States, or because of his having so exercised the same; or

If two or more persons go in disguise on the highway, or on the premises of another, with intent to prevent or hinder his free exercise or enjoyment of any right or privilege so secured-

They shall be fined under this title or imprisoned not more than ten years, or both; and if death results from the acts committed in violation of this section or if such acts include kidnapping or an attempt to kidnap, aggravated sexual abuse or an attempt to commit aggravated sexual abuse, or an attempt to kill, they shall be fined under this title or imprisoned for any term of years or for life, or both, or may be sentenced to death.

18 USC 242: Deprivation of rights under color of law:

Whoever, under color of any law, statute, ordinance, regulation, or custom, willfully subjects any person in any State, Territory, Commonwealth, Possession, or District to the deprivation of any rights, privileges, or immunities secured or protected by the Constitution or laws of the United States, or to different punishments, pains, or penalties, on account of such person being an alien, or by reason of his color, or race, than are prescribed for the punishment of citizens, shall be fined under this title or imprisoned not more than one year, or both; and if bodily injury results from the acts committed in violation of this section or if such acts include the use, attempted use, or threatened use of a dangerous weapon, explosives, or fire, shall be fined under this title or imprisoned not more than ten years, or both; and if death results from the acts committed in violation of this section or if such acts include kidnapping or an attempt to kidnap, aggravated sexual abuse, or an attempt to commit aggravated sexual abuse, or an attempt to kill, shall be fined under this title, or imprisoned for any term of years or for life, or both, or may be sentenced to death.

Subject: Comments for the Immunizations Technical Advisory Group

External Email

Good Morning,

I would like to submit my comments opposing inclusion of the COVID-19 vaccine requirement for children from daycare through Grade 12. My focus and objections are primarily for those that are younger, but the logic applies to all young children.

Studies have clearly shown that the benefit of the vaccine is minimal, if any, for young children in elementary school. Additionally, as the parent of a 6 year old, I can say, from first hand experience, that the effect of COVID on a 6 year old is minimal. My wife and I are vaccinated, but caught a mild breakthrough infection in early January of 2022, most likely with Omicron. We were mildly sick for 1.5 to 2 days. My daughter who is unvaccinated had a fever for a few hours one evening and was back to normal by morning. I also observed this in several of her school peers and cousins; they all had either no symptoms or a fever for a few hours. I believe I can live with that for my daughter. Kids have shared food and drink, removed masks, and acted like kids during the last year, and the vast majority have been fine.

At this point, I believe the risks of mandating vaccines for young children exponentially exceed the benefits. I believe in vaccines for adults and perhaps even for college age children, but not for little ones that get little or no benefit from these vaccines. Pfizer's own studies have shown that the benefit was minimal if any, and those results are often skewed to promote their products.

Risk to children include myocarditis, nerve damage, sore arms, and other ailments that we still do not know enough about. I do not believe we should do this to our children.

Thank you for listening to our feedback.

--

Glenn

To the board members and members voting on item 5 and item 6 in February 10, 2022 meeting, I am here as a mother and representing the community of Kent Washington.

You previously held a similar meeting where over 30,000 people sent emails or attended the zoom meeting. You heard our voices. We do NOT accept you making health decisions over us or our children.

We have provided you with studies and other sources of data that shows your agency is out of line and your decisions are political.

How dare you tell us to step aside and let the experts do their work?

We have seen your "science". I find it interesting that if we look directly at each hospital's Covid situation as far as ICU, general or death, your reports deviate quite a bit from theirs. It seems vaccinated are higher numbers than unvaccinated. Also, why are you including data from a year ago, when the virus has changed from delta to omicron as of December of 2021. Omicron is much less deadly so your statistics do not show current and real statistic for the variance we are dealing with.

We also now know that both vaccinated and unvaccinated spread and get Covid, at possibly a higher rate for the vaccinated. Have you done your due diligence and researched this number in this state?

And why are we relying on PCR Covid tests to build data, when FDA no longer find them reliable?

I do recommend that you attend Dr Malones seminar that is being held in Gig Harbor this month if you want to listen to experts.

He is far superior to any of you who call yourself experts. Look at his track record. In fact, I would love to see you having a panel discussion about vaccines with him. He can help you understand science.

Since your last public meeting, the world has changed. Millions of people are demonstrating against vaccine mandates and mask mandates all around the world. Convoy started in Canada and just today; Ontario declared removal of vaccine passport, and masks from children publicly and in school effective immediately.

Oregon is removing their mask mandate 3/31 or sooner.
California is planning to remove their mask mandates.

UK has removed their mandates.
Sweden has removed their mandates

These countries are currently planning or are in the midst of freedom convoys. Remember eyes are on you, and the world will know that you went against freedom of choice and they will know you forced children out of the school system. Because we will not comply.

While you are so concerned about the vaccine, you have forgotten about increased child and young adult suicide due to isolation, no school or on line schooling, mask cover, 6 feet distance to your friends, and loss of social life. You are not concerned about the mental health of Washington state citizens. Those who have lost their jobs in careers they were previously looked at as hero's. Some have 20+ years in the industry. Some are still paying of their school loan from a career that is now long gone. You have not looked at the health of those businesses that had to close temporarily or completely during the lockdown. You are forcing business owners to implement vaccine passports, while they are loosing thousands of dollars monthly in revenue due to lost business. Divorces and mental health issues are over the roof. You do not care about health, it has been proven. Instead you take advise from a governor who had placed himself in forever emergency power, CDC and FDA, two organizations that are highly financially involved with Pfizer and Moderna. Did you notice the same people sit on both boards?

Over and over, in federal courts and supreme court it has been ruled that mandating vaccine is unconstitutional.

Here are some facts. I doubt you will read the links but you have been informed. This is my notice.

You are trying to mandate a drug that is not FDA approved to children. This is illegal:

<https://crsreports.congress.gov/product/pdf/R/R46913>

<https://www.fda.gov/media/151710/download>

EUA - Sept 29, 2021 (Comirnaty vs. Pfizer/ BioNTech) shots - not the same

Listen to data about effectiveness of vaccine here:

<https://www.canadiancovidcarealliance.org/>

Injuries.... Lots of injuries

<https://www.covidvaccinevictims.com/>

Why does OSHA require fit testing, training, and safe disposal of respirators, but our school kids are just thrown in any old medical device as though all bodies are the same? "29 CFR 1910.134, Respiratory Protection Standard."

https://www.osha.gov/sites/default/files/enforcement/directives/CPL_02-00-158.pdf

A study of why school children should not get C shots.

<https://alethonews.com/2021/11/05/6-studies-showing-why-children-dont-need-and-shouldnt-get-a-covid-vaccine/>

Sweden's health department recommends children under 12 should not take the vaccine.

You giving yourself the "supreme right" to vote over the safety of our children is despicable. You are overstepping your authority by suggesting any medical advice for children that you have not medically evaluated as their physician, and so do the school boards and schools who enforce this requirement.

You MUST consider every student's medical needs. We the parents will make decisions relating to our children's health within our own families and with our own medical

providers.

And for Masks:

Lots of studies on mask Effectiveness:

<https://www.sciencedaily.com/releases/2015/04/150422121724.htm>

<https://pubmed.ncbi.nlm.nih.gov/25903751/>

<https://pubmed.ncbi.nlm.nih.gov/18500410/>

<https://pubmed.ncbi.nlm.nih.gov/33254499/>

<https://www.nejm.org/doi/full/10.1056/NEJMp2006372>

Info on children and masks:

<https://thehill.com/opinion/education/514742-masks-for-all-children-arent-needed-or-ethical>

<https://swprs.org/face-masks-evidence/>

Further more, child abuse is illegal:

section 1. vaccine injury (who will be responsible for a vaccine injury of a child? and section D; forcing children to wear masks.

While most other states in this country has removed restrictions and mandates and their children's lives has gone back to normal, Washington state children are being raised in fear, and being forced to comply with government and health official's over reach.

Have you seen all the thousands of vaccine injuries and deaths to athletes around the world? You are public figures, the world will hold you accountable. It takes only 1 proven vaccine death to charge you for murder, just like what happened in UK and what ultimately caused the restrictions to be removed in UK.

Start working on the real issues of mental health issues caused by this governments overreach and agencies like yours who support them.

Subject: Covid-19 Vaccine Inclusion for Students

External Email

To Whom It May Concern,

I oppose vaccine inclusion for students in any education institution. There is very little to no evidence to suggest that the Covid-19 vaccine prevents transmission of the virus to others or that it protects children. Covid-19 is not a threat to the majority of students and they experience mild to zero symptoms of Covid-19. It is more risky for a child to receive an experimental mRNA vaccine than for a child to become infected with Covid-19. Further more, there is no current published literature on pediatric Covid-19 vaccine effectiveness in the K-12 setting. While suicide is the third leading cause of death in teenagers ages 15-19 in WA state, Covid-19 is far down the list of causes of death for children in Washington state. Due to this information and more I oppose vaccine inclusion/requirements for students to attend any education institution.

Thank you

There are many of us who do not support vaccination of our children or ourselves and will fight to protect our children from mandates. With all the required or recommended shots our children will already have had over 70 different vaccines by the time they are 18. This is frightening that science is regarded as overruling natural immunity of Creator's Design 100 % of the time.

Mandates are not going to save us when no education is perpetuated for keeping our bodies strong with organic food and proper nutrition. Where is this education for how to treat someone struggling to recover from sickness no matter how it is deemed to be spread? I declare that it is stymied by Industries of Capitalism. Many will be watching this debate and fighting to keep our bodies free of contamination we do not choose.

Sincerely,
G Barton

Subject: TAG Meeting 2/10/2022 Covid-19 Vaccine

External Email

To Whom It May Concern,

I am a concerned parent writing to the WA State Board of Health and the TAG Team, regarding the discussion about Covid-19 Vaccine and mandating it for children to attend any type of schooling or childcare in WA State.

I am against this mandate and it possibly becoming a WA State law.

The Covid-19 vaccine has not shown to completely stop the spread of Covid-19. I am aware that it could possibly reduce the virus symptoms. For the majority of children, the Covid-19 virus is not fatal. It would be wrong to mandate it, or make it a law to attend school, due to the fact that it doesn't stop the spread.

Since there are around 71% of WA state, of the age of over 5, that have the Covid-19 vaccine and many more that have had the virus and have natural immunity, it doesn't make sense to make it mandatory for those who choose to not get the vaccine.

I pray that you all take this into consideration, not everyone wants to get this vaccine. We still don't know the long term side effects of this vaccine in anyone. It is our constitutional rights as citizens in the United States of America and of Washington State, to choose what we want to do with our bodies.

Please vote no on making the Covid-19 vaccine mandatory or into law in order to attend school or any childcare in Washington State.

Sincerely,

Heidi von Olnhausen

I am urging you NOT to require covid vaccines for school attendance. We know vaccines do NOT stop the spread but may only help to not get as severe of infection. There is NO justification then as it will not change or affect covid spread. Natural immunity is more efficient and clearly with Omicron it does not matter if vaccinated or not in how fast it spreads. I know the 400 plus wrestlers were 95% plus vaccinated. I can not even imagine it would be legal to require given the scientific facts on lack of benefit to reduce spread and how effective natural immunity is and large majority of school kids already exposed so will have immunity. take a look at facts in Isreal right now. The vast majority of people have at least 1 if not 2 BOOSTERS and they are one of highest covid rates! CLEARLY vaccines not slowing the spread. There are risks with vaccines look it up on VAERS data. For kids who have had covid there is no benefit and with how generally mild omicron is our best chance to reach endemic state is not to keep vaccinating, its not working just helping some not to be severely ill. You would be penalizing so many kids for NO community benefit. You cannot take away personal choice for nothing especially for so many kids who have already had covid and are immune. I know many families in my office already looking and talking to lawyers. It is prejudice and irresponsible to require something that can cause harm and effects genes without having any benefit to the school community at large. Its like no one really wants to look at the facts. they ignore what's goin on in Israel and even seattle was one of highest Covid rates yet had high vaccination status. these vaccine do not work as well as we want to believe and again DO NOT STOP SPREAD. so there is no justification or benefit to the school community and could cause great harm to many children who are already behind due to the missing in person school. Shame on everyone for even thinking this is a good idea. Look up the facts quit causing our children harm. lets stop just assuming things I know we have all been brain washed into thinking vaccines will slow spread it is just not the truth. Yes they ay reduce hospitalizations but who knows on the long run if there may be harm to the immune system and how dare you think about taking a parents choice away without there being any benefit in stopping the spread. I fear for the harm this can do to so many and the legal battles tat will divide us even more.

Subject: No to Covid-19 Coronavirus Immunization Criteria

External Email

Hello, Washington State Board of Health,

I am writing to you to request you not to put the Covid-19/or/Coronavirus (seasonal flue) Vaccination as a requirement for children to go to school in Washington State. You know that what you are requiring is against the constitution and against science. You know you are pushing this against people's will. You know the Covid-19 vaccine is not a true vaccine and it has caused many injuries in young people and killed many. And you are still pushing it for your own benefit!!!! "NO" to Crimes Against Humanity! Consider yourself served.

Vote NO on mandatory covid-19/coronavirus vaccination now and always.

DO NO HARM! Hipocratic Oath!!!

I OPPOSE the use of illegal force to detain ANY family OR children. This is insane!! Have we not learned about the holocaust and internment camps? What you are trying to pass is illegal and unconstitutional! There are thousands of us trying to leave comments on this matter and we will continue. I will be on every zoom or meeting you have throughout this charade! I will comment every time because this is against Washington Constitution!!

There are studies that show this type of agenda does not reduce transmission whatsoever. I would love to hear your thoughts on the vaccinated still being able to get Covid and spread it. According to even more studies this plandemic didn't get out of hand until the experimental shots were starting to be administered.

Forced mandates opposes our rights as free Americans- it also disrupts an active healthy immune response. Many studies now conclude that the highest vaccinated areas are highest for deaths and risky health concerns. Freedom of choice should never be infringed upon.

THE PEOPLE HAVE SPOKEN AND WE THE PEOPLE SAY NO!

WE THE PEOPLE SAY NO!

Just in case you forgot, WE the PEOPLE saw the WAC 246-100-040 on the agenda you tried to hide.

The data on harms to children from the experimental gene therapy injections are mounting every day, including myocarditis in boys. You are well aware of the high incidence of the myocarditis and you are still driven to put this in every arm. The vaccines have failed. You are now more likely to get Covid, especially Omicron, if you are vaccinated than if you are not vaccinated. This must stop. It is no longer about Covid or injections.....this is about God given rights guaranteed in our Constitution. Stop the insanity.

We appreciate your grace in allowing us to view your meeting yesterday.

However, what we do not appreciate is the mockery presented in the beginning of your signaling before the meeting got under way.

There are citizens who will never go under the advisement of Health Boards, regardless.

Trying to mandate a vaccine such as COVID that shows merely profit through taxpayer's pay off (once again) is morally bankrupt.

It is honestly a real disappointment that we are exchanging expectations on a virus that is relatable to the flu.

We have lost people to this catastrophic occurrence, as with life, death occurs.

For you to NOT mandate COVID vaccines ever, should be forever consistent.

You DO NOT mandate something as simple as the FLU except in the military, which I find overboard & uncalled for there as well.

The most disturbing piece to this whole take over, is people cannot understand how to function with a bit of what we knew to be normalcy.

Anything from to interaction & connecting with other humans, to driving & common sense.

You have people so worked up, it is a continual intrusion on our lives.

IF any of your jobs were ever voted upon, I would hope that the registered voters of our state would vote accordingly.

However, seeing the current "leadership" in the Governor's office, I could be gravely mistaken.

I have not had COVID THIS WHOLE ORDEAL stemming back from late 2019.

I have utilized my natural antibodies to combat EVERYTHING else I may have encountered in my daily routine & interactions.

From performing my work with the public to going into stores, etc.

NOTHING still

I just took a test last night, due to ONLY concerns of others. And of course, I WAS NEGATIVE!!!!!!!

EVEN though I have an underperforming immune system, I WILL NEVER stop my life. NOT for COVID especially.

A great point is made over & over, why should we mandate this for US citizens, when your FED GOV is allowing massively infected non US citizens into our Country???

Studies in Applied Economics

**A LITERATURE REVIEW AND META-ANALYSIS
OF THE EFFECTS OF LOCKDOWNS ON
COVID-19 MORTALITY**

Jonas Herby, Lars Jonung, and Steve H. Hanke

Johns Hopkins Institute for Applied Economics,
Global Health, and the Study of Business Enterprise

A Literature Review and Meta-Analysis of the Effects of Lockdowns on COVID-19 Mortality

By Jonas Herby, Lars Jonung, and Steve H. Hanke

About the Series

The *Studies in Applied Economics* series is under the general direction of Prof. Steve H. Hanke, Founder and Co-Director of The Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise (hanke@jhu.edu). The views expressed in each working paper are those of the authors and not necessarily those of the institutions that the authors are affiliated with.

About the Authors

Jonas Herby (herby@cepos.dk) is special advisor at Center for Political Studies in Copenhagen, Denmark. His research focuses on law and economics. He holds a master's degree in economics from University of Copenhagen.

Lars Jonung (lars.jonung@nek.lu.se) is professor emeritus in economics at Lund University, Sweden. He served as chairperson of the Swedish Fiscal Policy Council 2012-13, as research advisor at the European Commission 2000-2010, and as chief economic adviser to Prime Minister Carl Bildt in 1992-94. He holds a PhD in Economics from the University of California, Los Angeles.

Steve H. Hanke is a Professor of Applied Economics and Founder & Co-Director of The Johns Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise. He is a Senior Fellow and Director of the Troubled Currencies Project at the Cato Institute, a contributor at National Review, a well-known currency reformer, and a currency and commodity trader. Prof. Hanke served on President Reagan's Council of Economic Advisers, has been an adviser to five foreign heads of state and five foreign cabinet ministers, and held a cabinet-level rank in both Lithuania and Montenegro. He has been awarded seven honorary doctorate degrees and is an Honorary Professor at four foreign institutions. He was President of Toronto Trust Argentina in Buenos Aires in 1995, when it was the world's best-performing mutual fund. Currently, he serves as Chairman of the Supervisory Board of Advanced Metallurgical Group N.V. in Amsterdam. In 1998, he was named one of the twenty-five most influential people in the world by World Trade Magazine. In 2020, Prof. Hanke was named a Knight of the Order of the Flag.

Abstract

This systematic review and meta-analysis are designed to determine whether there is empirical evidence to support the belief that “lockdowns” reduce COVID-19 mortality. Lockdowns are defined as the imposition of at least one compulsory, non-pharmaceutical intervention (NPI). NPIs are any government mandate that directly restrict peoples’ possibilities, such as policies that limit internal movement, close schools and businesses, and ban international travel. This study employed a systematic search and screening procedure in which 18,590 studies are identified that could potentially address the belief posed. After three levels of screening, 34 studies ultimately qualified. Of those 34 eligible studies, 24 qualified for inclusion in the meta-analysis. They were separated into three groups: lockdown stringency index studies, shelter-in-place-order (SIPO) studies, and specific NPI studies. An analysis of each of these three groups support the conclusion that lockdowns have had little to no effect on COVID-19 mortality. More specifically, stringency index studies find that lockdowns in Europe and the United States only reduced COVID-19 mortality by 0.2% on average. SIPOs were also ineffective, only reducing COVID-19 mortality by 2.9% on average. Specific NPI studies also find no broad-based evidence of noticeable effects on COVID-19 mortality.

While this meta-analysis concludes that lockdowns have had little to no public health effects, they have imposed enormous economic and social costs where they have been adopted. In consequence, lockdown policies are ill-founded and should be rejected as a pandemic policy instrument.

Key Words: COVID-19, lockdown, non-pharmaceutical interventions, mortality, systematic review, meta-analysis

JEL Classification: I18; I38; D19

1 Introduction

The global policy reaction to the COVID-19 pandemic is evident. Compulsory non-pharmaceutical interventions (NPIs), commonly known as “lockdowns” – policies that restrict internal movement, close schools and businesses, and ban international travel – have been mandated in one form or another in almost every country.

The first NPIs were implemented in China. From there, the pandemic and NPIs spread first to Italy and later to virtually all other countries, see Figure 1. Of the 186 countries covered by the Oxford COVID-19 Government Response Tracker (OxCGRT), only Comoros, an island country in the Indian Ocean, did not impose at least one NPI before the end of March 2020.

Figure 1: Share of countries with OxCGRT stringency index above thresholds, January - June 2020

Comment: The figure shows the share of countries, where the OxCGRT stringency index on a given date surpassed index 65, 70 and 75 respectively. Only countries with more than one million citizens are included (153 countries in total). The OxCGRT stringency index records the strictness of NPI policies that restrict people's behavior. It is calculated using all ordinal containment and closure policy indicators (i.e., the degree of school and business closures, etc.), plus an indicator recording public information campaigns.

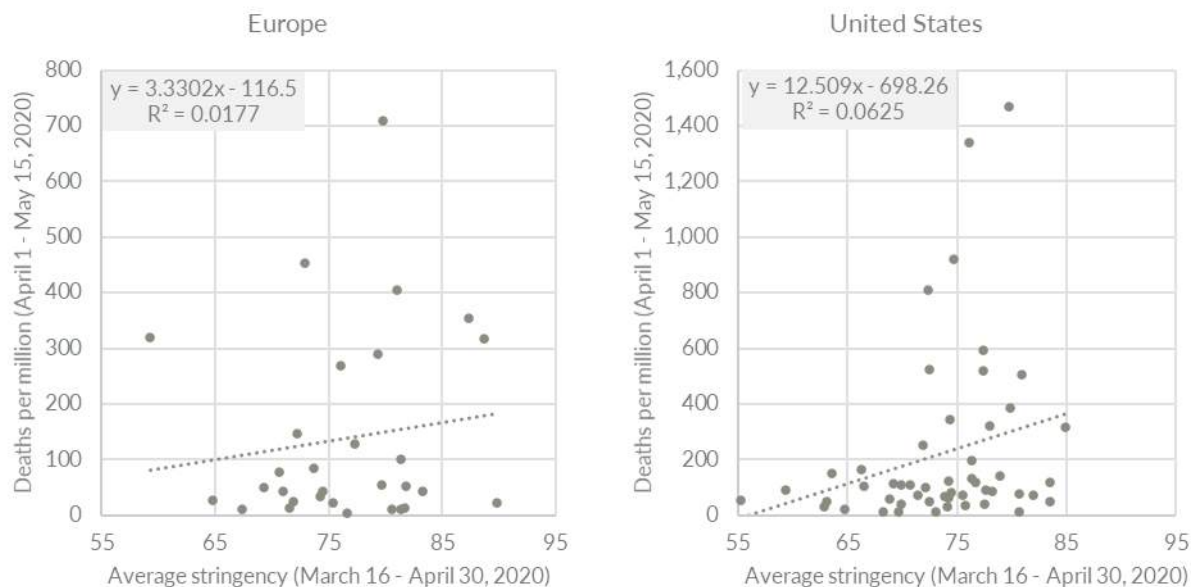

Source: Our World in Data.

Early epidemiological studies predicted large effects of NPIs. An often cited model simulation study by researchers at the Imperial College London (Ferguson et al. (2020)) predicted that a

suppression strategy based on a lockdown would reduce COVID-19 mortality by up to 98%.¹ These predictions were questioned by many scholars. Our early interest in the subject was spurred by two studies. First, Atkeson et al. (2020) showed that “across all countries and U.S. states that we study, the growth rates of daily deaths from COVID-19 fell from a wide range of initially high levels to levels close to zero within 20-30 days after each region experienced 25 cumulative deaths.” Second, Sebhatu et al. (2020) showed that “government policies are strongly driven by the policies initiated in other countries,” and less by the specific COVID-19-situation of the country.

A third factor that motivated our research was the fact that there was no clear negative correlation between the degree of lockdown and fatalities in the spring of 2020 (see Figure 2). Given the large effects predicted by simulation studies such as Ferguson et al. (2020), we would have expected to at least observe a simple negative correlation between COVID-19 mortality and the degree to which lockdowns were imposed.²

Figure 2: Correlation between stringency index and COVID-19 mortality in European countries and U.S. states during the first wave in 2020

Source: Our World in Data

¹ With $R_0 = 2.4$ and trigger on 60, the number of COVID-19-deaths in Great Britain could be reduced to 8,700 deaths from 510,000 deaths (-98%) with a policy consisting of case isolation + home quarantine + social distancing + school/university closure, cf. Table 4 in Ferguson et al. (2020). R_0 (the basic reproduction rate) is the expected number of cases directly generated by one case in a population where all individuals are susceptible to infection.

² In addition, the interest in this issue was sparked by the work Jonung did on the expected economic effects of the SARS pandemic in Europe in 2006 (Jonung and Röger, 2006). In this model-based study calibrated from Spanish flu data, Jonung and Röger concluded that the economic effects of a severe pandemic would be rather limited—a sharp contrast to the huge economic effects associated with lockdowns during the COVID-19 pandemic.

Today, it remains an open question as to whether lockdowns have had a large, significant effect on COVID-19 mortality. We address this question by evaluating the current academic literature on the relationship between lockdowns and COVID-19 mortality rates.³ We use “NPI” to describe *any government mandate which directly restrict peoples’ possibilities*. Our definition does *not* include governmental recommendations, governmental information campaigns, access to mass testing, voluntary social distancing, etc., but *do* include mandated interventions such as closing schools or businesses, mandated face masks etc. We define *lockdown* as any policy consisting of at least one NPI as described above.⁴

Compared to other reviews such as Herby (2021) and Allen (2021), the main difference in this meta-analysis is that we carry out a systematic and comprehensive search strategy to identify all papers potentially relevant to answer the question we pose. We identify 34 eligible empirical studies that estimate the effect of mandatory lockdowns on COVID-19 mortality using a counterfactual difference-in-difference approach. We present our results in such a way that they can be systematically assessed, replicated, and used to derive overall meta-conclusions.⁵

2 Identification process: Search strategy and eligibility criteria

Figure 3 shows an overview of our identification process using a flow diagram designed according to PRISMA guidelines (Moher et al. (2009)). Of 18,590 studies identified during our database searches, 1,048 remained after a title-based screening. Then, 931 studies were excluded, because they either did not measure the effect of lockdowns on mortality or did not use an empirical approach. This left 117 studies that were read and inspected. After a more thorough assessment, 83 of the 117 were excluded, leaving 34 studies eligible for our meta-analysis. A table with all 83 studies excluded in the final step can be found in Appendix B, Table 8.

³ We use “mortality” and “mortality rates” interchangeably to mean COVID-19 deaths per population.

⁴ For example, we will say that Country A introduced the *non-pharmaceutical interventions* school closures and shelter-in-place-orders as part of the country’s *lockdown*.

⁵ An interesting question is, “What damage lockdowns do to the economy, personal freedom and rights, and public health in general?” Although this question is important, it requires a full cost-benefit study, which is beyond the scope of this study.

Figure 3: PRISMA flow diagram for the selection of studies.

Below we present our search strategy and eligibility criteria, which follow the PRISMA guidelines and are specified in detail in our protocol Herby et al. (2021).

2.1 Search strategy

The studies we reviewed were identified by scanning *Google Scholar* and *SCOPUS* for English-language studies. We used a wide range of search terms which are combinations of three search strings: a disease search string ("covid," "corona," "coronavirus," "sars-cov-2"), a government

response search string⁶, and a methodology search string⁷. We identified papers based on 1,360 search terms. We also required mentions of “deaths,” “death,” and/or “mortality.” The search terms were continuously updated (by adding relevant terms) to fit this criterion.⁸

We also included all papers published in *Covid Economics*. Our search was performed between July 1 and July 5, 2021 and resulted in 18,590 unique studies.⁹ All studies identified using SCOPUS and Covid Economics were also found using Google Scholar. This made us comfortable that including other sources such as VOXeu and SSRN would not change the result. Indeed, many papers found using Google Scholar were from these sources.

All 18,590 studies were first screened based on the title. Studies clearly not related to our research question were deemed irrelevant.¹⁰

After screening based on the title, 1,048 papers remained. These papers were manually screened by answering two questions:

1. Does the study measure the effect of lockdowns on mortality?
2. Does the study use an empirical *ex post* difference-in-difference approach (see eligibility criteria below)?

Studies to which we could not answer “yes” to both questions were excluded. When in doubt, we made the assessment based on reading the full paper, and in some cases, we consulted with colleagues.¹¹

After the manual screening, 117 studies were retrieved for a full, detailed review. These studies were carefully examined, and metadata and empirical results were stored in an Excel

⁶ The government response search string used was: “non-pharmaceutical,” “nonpharmaceutical,” “NPI,” “NPIs,” “lockdown,” “social distancing orders,” “statewide interventions,” “distancing interventions,” “circuit breaker,” “containment measures,” “contact restrictions,” “social distancing measures,” “public health policies,” “mobility restrictions,” “covid-19 policies,” “corona policies,” “policy measures.”

⁷ The methodology search string used was: (“fixed effects,” “panel data,” “difference-in-difference,” “diff-in-diff,” “synthetic control,” “counterfactual” , “counter factual,” “cross country,” “cross state,” “cross county,” “cross region,” “cross regional,” “cross municipality,” “country level,” “state level,” “county level,” “region level,” “regional level,” “municipality level,” “event study.”

⁸ If a potentially relevant paper from one of the 13 reviews (see eligibility criteria) did not show up in our search, we added relevant words to our search strings and ran the search again. The 13 reviews were: Allen (2021); Brodeur et al. (2021); Gupta et al. (2020); Herby (2021); Johanna et al. (2020); Nussbaumer-Streit et al. (2020); Patel et al. (2020); Perra (2020); Poeschl and Larsen (2021); Pozo-Martin et al. (2020); Rezapour et al. (2021); Robinson (2021); Zhang et al. (2021).

⁹ SCOPUS was continuously monitored between July 5th and publication using a search agent. Although the search agent returned several hits during this period, only one of them, An et al. (2021), was eligible according to our eligibility criteria. The study is not included in our review, but the conclusions are in line with our conclusions, as An et al. (2021) conclude that “The analysis shows that the mask mandate is consistently associated with lower infection rates in the short term, and its early adoption boosts the long-term efficacy. By contrast, the other five policy instruments—domestic lockdowns, international travel bans, mass gathering bans, and restaurant and school closures—show weaker efficacy.”

¹⁰ This included studies with titles such as “COVID-19 outbreak and air pollution in Iran: A panel VAR analysis” and “Dynamic Structural Impact of the COVID-19 Outbreak on the Stock Market and the Exchange Rate: A Cross-country Analysis Among BRICS Nations.”

¹¹ Professor Christian Bjørnskov of University of Aarhus was particularly helpful in this process.

spreadsheet. All studies were assessed by at least two researchers. During this process, another 64 papers were excluded because they did not meet our eligibility criteria. Furthermore, nine studies with too little jurisdictional variance (< 10 observations) were excluded,¹² and 10 synthetic control studies were excluded.¹³ A table with all 83 studies excluded in the final step can be found in Appendix B, Table 8. Below we explain why these studies are excluded.

2.2 Eligibility criteria

Focus on mortality and lockdowns

We only include studies that attempt to establish a relationship (or lack thereof) between lockdown policies and COVID-19 mortality or excess mortality. We exclude studies that use cases, hospitalizations, or other measures.¹⁴

Counterfactual difference-in-difference approach

We distinguish between two methods used to establish a relationship (or lack thereof) between mortality rates and lockdown policies. The first uses registered cross-sectional mortality data. These are *ex post* studies. The second method uses simulated data on mortality and infection rates.¹⁵ These are *ex ante* studies.

We include all studies using a counterfactual difference-in-difference approach from the former group but disregard all *ex ante* studies, as the results from these studies are determined by model assumptions and calibrations.

Our limitation to studies using a “counterfactual difference-in-difference approach” means that we exclude all studies where the counterfactual is based on forecasting (such as a SIR-model) rather than derived from a difference-in-difference approach. This excludes studies like Duchemin et al. (2020) and Matzinger and Skinner (2020). We also exclude all studies based on interrupted time series designs that simply compare the situation before and after lockdown, as

¹²The excluded studies with too few observations were: Alemán et al. (2020), Berardi et al. (2020), Conyon et al. (2020a), Coccia (2021), Gordon et al. (2020), Juranek and Zoutman (2021), Kapoor and Ravi (2020), Umer and Khan (2020), and Wu and Wu (2020).

¹³ The excluded synthetic control studies were: Conyon and Thomsen (2021), Dave et al. (2020), Ghosh et al. (2020), Born et al. (2021), Reinbold (2021), Cho (2020), Friedson et al. (2021), Neidhöfer and Neidhöfer (2020), Cerqueti et al. (2021), and Mader and Rüttenauer (2021).

¹⁴ Analyses based on cases may pose major problems, as testing strategies for COVID-19 infections vary enormously across countries (and even over time within a given country). In consequence, cross-country comparisons of cases are, at best, problematic. Although these problems exist with death tolls as well, they are far more limited. Also, while cases and death tolls are correlated, there may be adverse effects of lockdowns that are not captured by the number of cases. For example, an infected person who is isolated at home with family under a SIPO may infect family members with a higher viral load causing more severe illness. So even if a SIPO reduces the number of cases, it may theoretically increase the number of COVID-19-deaths. Adverse effects like this may explain why studies like Chernozhukov et al. (2021) finds that SIPO reduces the number of cases but have no significant effect on the number of COVID-19-deaths. Finally, mortality is hierarchically the most important outcome, cf. GRADEpro (2013)

¹⁵ These simulations are often made in variants of the SIR-model, which can simulate the progress of a pandemic in a population consisting of people in different states (Susceptible, Infectious, or Recovered) with equations describing the process between these states.

the effect of lockdowns in these studies might contain time-dependent shifts, such as seasonality. This excludes studies like Bakolis et al. (2021) and Siedner et al. (2020).

Given our criteria, we exclude the much-cited paper by Flaxman et al. (2020), which claimed that lockdowns saved three million lives in Europe. Flaxman et al. assume that the pandemic would follow an epidemiological curve unless countries locked down. However, this assumption means that the only interpretation possible for the empirical results is that lockdowns are the only thing that matters, even if other factors like season, behavior etc. caused the observed change in the reproduction rate, R_t . Flaxman et al. are aware of this and state that “our parametric form of R_t assumes that changes in R_t are an immediate response to interventions rather than gradual changes in behavior.” Flaxman et al. illustrate how problematic it is to force data to fit a certain model if you want to infer the effect of lockdowns on COVID-19 mortality.¹⁶

The counterfactual difference-in-difference studies in this review generally exploit variation across countries, U.S. states, or other geographical jurisdictions to infer the effect of lockdowns on COVID-19 fatalities. Preferably, the effect of lockdowns should be tested using randomized control trials, natural experiments, or the like. However, there are very few studies of this type.¹⁷

Synthetic control studies

The synthetic control method is a statistical method used to evaluate the effect of an intervention in comparative case studies. It involves the construction of a synthetic control which functions as the counterfactual and is constructed as an (optimal) weighted combination of a pool of donors. For example, Born et al. (2021) create a synthetic control for Sweden which consists of 30.0% Denmark, 25.3% Finland, 25.8% Netherlands, 15.0% Norway, and 3.9% Sweden. The effect of the intervention is derived by comparing the actual developments to those contained in the synthetic control.

We exclude synthetic control studies because of their inherent empirical problems as discussed by Bjørnskov (2021b). He finds that the synthetic control version of Sweden in Born et al. (2021) deviates substantially from “actual Sweden,” when looking at the period before mid-March 2020, when Sweden decided not to lock down. Bjørnskov estimates that *actual Sweden* experienced

¹⁶ Several scholars have criticized Flaxman et al. (2020), e.g. see Homburg and Kuhbandner (2020), Lewis (2020), and Lemoine (2020).

¹⁷ Kepp and Bjørnskov (2021) is one such study. They use evidence from a quasi-natural experiment in the Danish region of Northern Jutland. After the discovery of mutations of Sars-CoV-2 in mink – a major Danish export – seven of the 11 municipalities of the region went into extreme lockdown in early November, while the four other municipalities retained the moderate restrictions of the remaining country. Their analysis shows that while infection levels decreased, they did so before lockdown was in effect, and infection numbers also decreased in neighbor municipalities without mandates. They conclude that efficient infection surveillance and voluntary compliance make full lockdowns unnecessary, at least in some circumstances. Kepp and Bjørnskov (2021) is not included in our review, because they focus on cases and not COVID-19 mortality. Dave et al. (2020) is another such study. They see the Wisconsin Supreme Court abolishment of Wisconsin’s “Safer at Home” order (a SIPO) as a natural experiment and find that “the repeal of the state SIPO impacted social distancing, COVID-19 cases, or COVID-19-related mortality during the fortnight following enactment.” Dave et al. (2020) is not included in our review, because they use a synthetic control method.

approximately 500 fewer deaths the first 11 weeks of 2020 and 4,500 fewer deaths in 2019 compared to *synthetic Sweden*.

This problem is inherent in all synthetic control studies of COVID-19, Bjørnskov argues, because the synthetic control should be fitted based on a long period of time before the intervention or the event one is studying the consequences of – i.e., the lockdown Abadie (2021). However, this is not possible for the coronavirus pandemic, as there clearly *is* no long period with coronavirus before the lockdown. Hence, the synthetic control study approach is *by design* not appropriate for studying the effect of lockdowns.

Jurisdictional variance - few observations

We exclude all interrupted time series studies which simply compare mortality rates before and after lockdowns. Simply comparing data from before and after the imposition of lockdowns could be the result of time-dependent variations, such as seasonal effects. For the same reason, we also exclude studies with little jurisdictional variance.¹⁸ For example, we exclude Conyon et al. (2020b) who “exploit policy variation between Denmark and Norway on the one hand and Sweden on the other” and, thus, only have one jurisdictional area in the control group. Although this *is* a difference-in-difference approach, there is a non-negligible risk that differences are caused by much more than just differences in lockdowns. Another example is Wu and Wu (2020), who use all U.S. states, but pool groups of states so they end with basically three observations. None of the excluded studies cover more than 10 jurisdictional areas.¹⁹ One study is a special case of the jurisdictional variance criteria (Auger et al. (2020)). Those researchers analyze the effect of school closures in U.S. states and find that those closures reduce mortality by 35%. However, all 50 states closed schools between March 13, 2020, and March 23, 2020, which means that all difference-in-difference is based on maximum 10 days. Given the long lag between infection and death, there is a risk that Auger et al.’s approach is an interrupted time series analysis where they compare United States before and after school closures, rather than a true difference-in-difference approach. However, we choose to include this study, as it is eligible under our protocol Herby et al. (2021).

Publication status and date

We include all *ex post* studies regardless of publication status and date. That is, we cover both working papers and papers published in journals. We include the early papers because the knowledge of the COVID-19-pandemic grew rapidly in the beginning, making later papers able to stand on the shoulders of previous work. Also, in the early days of COVID-19, speed was

¹⁸ A jurisdictional area can be countries, U.S. states, or counties. With “jurisdictional variance” we refer to variation in mandates across jurisdictional areas.

¹⁹ All studies excluded on this criterion are listed in footnote 12.

crucial which may have affected the quality of the papers. Including them makes it possible to compare the results of early studies to studies carried out at a later stage.²⁰

The role of optimal timing

We exclude papers which analyze the effect of early lockdowns in contrast to later lockdowns. There's no doubt that being prepared for a pandemic and knowing when it arrives at your doorstep is vital. However, at least two problems arise with respect to evaluating the effect of well-timed lockdowns.

First, when COVID-19 hit Europe and the United States, it was virtually impossible to determine the right timing. The World Health Organization declared the outbreak a pandemic on March 11, 2020, but at that date, Italy had already registered 13.7 COVID-19 deaths per million. On March 29, 2020, 18 days after the WHO declared the outbreak a pandemic and the earliest a lockdown response to the WHO's announcement could potentially have an effect, the mortality rate in Italy was a staggering 178 COVID-19 deaths per million with an additional 13 per million dying each day.²¹

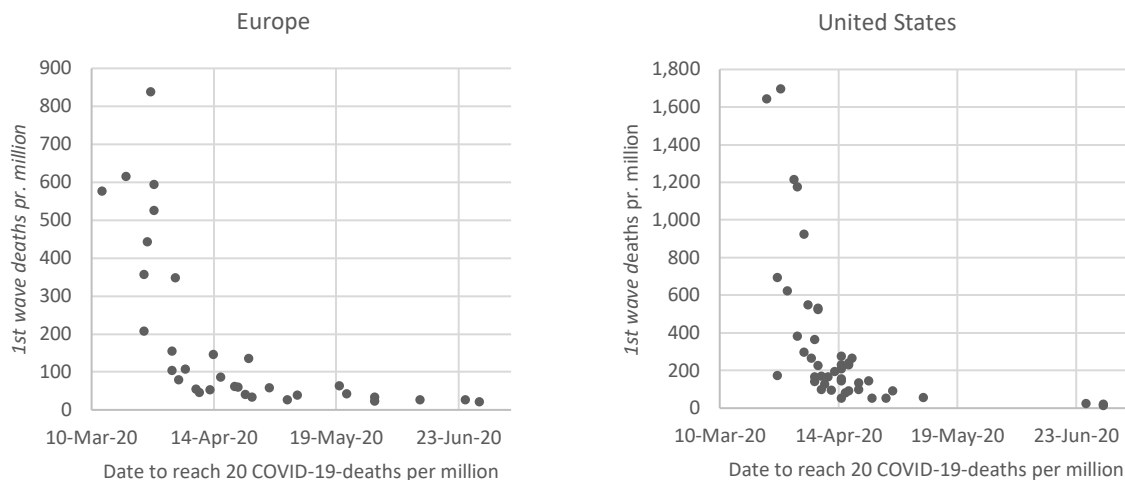

Secondly, it is extremely difficult to differentiate between the effect of public awareness and the effect of lockdowns when looking at timing because people and politicians are likely to react to the same information. As Figure 4 illustrates, all European countries and U.S. states that were hit hard and early by COVID-19 experienced high mortality rates, whereas all countries hit relatively late experienced low mortality rates. Björk et al. (2021) illustrate the difficulties in analyzing the effect of timing. They find that a 10-stringency-points-stricter lockdown would reduce COVID-19 mortality by a total of 200 deaths per million²² if done in week 11, 2020, but would only have approximately 1/3 of the effect if implemented one week earlier or later and no effect if implemented three weeks earlier or later. One interpretation of this result is that lockdowns do not work if people either find them unnecessary and fail to obey the mandates or if people voluntarily lock themselves down. This is the argument Allen (2021) uses for the ineffectiveness of the lockdowns he identifies. If this interpretation is true, what Björk et al. (2021) find is that information and signaling is far more important than the strictness of the lockdown. There may be other interpretations, but the point is that studies focusing on timing cannot differentiate between these interpretations. However, if lockdowns have a notable effect, we should see this effect regardless of the timing, and we should identify this effect more correctly by excluding studies that exclusively analyze timing.

²⁰ We also intended to exclude studies which were primarily based on data from 2021 (as these studies would be heavily affected by vaccines) and studies that did not cover at least one EU-country, the United States, one U.S. state or Latin America, and where at least one country/state was not an island. However, we did not find any such studies.

²¹ There's approximately a two-to-four-week gap between infection and deaths. See footnote 29.

²² They estimate that 10-point higher stringency will reduce excess mortality by 20 "per week and million" in the 10 weeks from week 14 to week 23.

Figure 4: Taken by surprise. The importance of having time to prepare

Comment: The figure shows the relationship between early pandemic strength and total 1st wave of COVID-19 death toll. On the X-axis is “Days to reach 20 COVID-19-deaths per million (measured from February 15, 2020).” The Y-axis shows mortality (deaths per million) by June 30, 2020.

Source: Reported COVID-19 deaths and OxCGRT stringency for European countries and U.S. states with more than one million citizens. Data from Our World in Data.

We are aware of one meta-analysis by Stephens et al. (2020), which looks into the importance of timing. The authors find 22 studies that look at policy and timing with respect to mortality rates, however, only four were multi-country, multi-policy studies, which could possibly account for the problems described above. Stephens et al. conclude that “the timing of policy interventions across countries relative to the first Wuhan case, first national disease case, or first national death, is not found to be correlated with mortality.” (See Appendix A for further discussion of the role of timing.)

3 The empirical evidence

In this section we present the empirical evidence found through our identification process. We describe the studies and their results, but also comment on the methodology and possible identification problems or biases.

3.1 Preliminary considerations

Before we turn to the eligible studies, we present some considerations that we adopted when interpreting the empirical evidence.

Empirical interpretation

While the policy conclusions contained in some studies are based on statistically significant results, many of these conclusions are ill-founded due to the tiny impact associated with said statistically significant results. For example, Ashraf (2020) states that “social distancing

measures has proved effective in controlling the spread of [a] highly contagious virus.” However, their estimates show that the average lockdown in Europe and the U.S only reduced COVID-19 mortality by 2.4%.²³ Another example is Chisadza et al. (2021). The authors argue that “less stringent interventions increase the number of deaths, whereas more severe responses to the pandemic can lower fatalities.” Their conclusion is based on a negative estimate for the squared term of *stringency* which results in a total negative effect on mortality rates (i.e. fewer deaths) for stringency values larger than 124. However, the stringency index is limited to values between 0 and 100 by design, so the conclusion is clearly incorrect. To avoid any such biases, we base our interpretations solely on the empirical estimates and not on the authors’ own interpretation of their results.

Handling multiple models, specifications, and uncertainties

Several studies adopt a number of models to understand the effect of lockdowns. For example, Bjørnskov (2021a) estimates the effect after one, two, three, and four weeks of lockdowns. For these studies, we select the longest time horizon analyzed to obtain the estimate closest to the long-term effect of lockdowns.

Several studies also use multiple specifications including and excluding potentially relevant variables. For these studies, we choose the model which the authors regard as their main specification. Finally, some studies have multiple models which the authors regard as equally important. One interesting example is Chernozhukov et al. (2021), who estimate two models with and without national case numbers as a variable. They show that including this variable in their model alters the results substantially. The explanation could be that people responded to national conditions. For these studies, we present both estimates in Table 1, but – following Doucouliagos and Paldam (2008) – we use an average of the estimates in our meta-analysis in order to not give more weight to a study with multiple models relative to studies with just one principal model.

For studies looking at different classes of countries (e.g. rich and poor), we report both estimates in Table 1 but use the estimate for rich Western countries in our meta-analysis, where we derive common estimates for Europe and the United States.

Effects are measured “relative to Sweden in the spring of 2020”

Virtually all countries in the world implemented mandated NPIs in response to the COVID-19 pandemic. Hence, most estimates are relative to “doing the least,” which in many Western countries means relative to doing as Sweden has done, especially during the first wave, when Sweden, do to constitutional constraints, implemented very few restrictions compared to other western countries (Jonung and Hanke 2020). However, some studies *do* compare the effect of doing something to the effect of doing absolutely nothing (e.g. Bonardi et al. (2020)).

The consequence is that some estimates are relative to “doing the least” while others are relative to “doing nothing.” This may lead to biases if “doing the least” works as a signal (or warning)

²³ We describe how we arrive at the 2.4% in Section 4.

which alters the behavior of the public. For example, Gupta et al. (2020) find a large effect of emergency declarations, which they argue “are best viewed as an information instrument that signals to the population that the public health situation is serious and they act accordingly,” on social distancing but not of other policies such as SIPOs (shelter-in-place orders). Thus, if we compare a country issuing a SIPO to a country doing nothing, we may overestimate the effect of a SIPO, because it is the sum of the signal *and* the SIPO. Instead, we should compare the country issuing the SIPO to a country “doing the least” to estimate the *marginal* effect of the SIPO.

To take an example, Bonardi et al. (2020) find relatively large effects of doing *something* but no effect of doing *more*. They find no extra effect of stricter lockdowns relative to less strict lockdowns and state that “our results point to the fact that people might adjust their behaviors quite significantly as partial measures are implemented, which might be enough to stop the spread of the virus.” Hence, whether the baseline is Sweden, which implemented a ban on large gatherings early in the pandemic, or the baseline is “doing nothing” can affect the magnitude of the estimated impacts. There is no obvious right way to resolve this issue, but since estimates in most studies are relative to doing less, we report results as compared to “doing less” when available. Hence, for Bonardi et al. we state that the effect of lockdowns is zero (compared to Sweden’s “doing the least”).

3.2 Overview of the findings of eligible studies

Table 1 covers the 34 studies eligible for our review.²⁴ Out of these 34 studies, 22 were peer-reviewed and 12 were working papers. The studies analyze lockdowns during the first wave. Most of the studies (29) use data collected before September 1st, 2020 and 10 use data collected before May 1st, 2020. Only one study uses data from 2021. All studies are cross-sectional, ranging across jurisdictions. Geographically, 14 studies cover countries worldwide, four cover European countries, 13 cover the United States, two cover Europe and the United States, and one covers regions in Italy. Seven studies analyze the effect of SIPOs, 10 analyze the effect of stricter lockdowns (measured by the OxCGRT stringency index), 16 studies analyze specific NIP’s independently, and one study analyzes other measures (length of lockdown).

Several studies find no statistically significant effect of lockdowns on mortality. For example, this includes Bjørnskov (2021a) and Stockenhuber (2020) who find no significant effect of stricter lockdowns (higher OxCGRT stringency index), Sears et al. (2020) and Dave et al. (2021), who find no significant effect of SIPOs, and Chaudhry et al. (2020), Aparicio and Grossbard (2021) and Guo et al. (2021) who find no significant effect of any of the analyzed NIP’s, including business closures, school closures and border closures.

Other studies find a significant negative relationship between lockdowns and mortality. Fowler et al. (2021) find that SIPOs reduce COVID-19 mortality by 35%, while Chernozhukov et al.

²⁴ The following information can be found for each study in Table 2.

(2021) find that employee mask mandates reduces mortality by 34% and closing businesses and bars reduces mortality by 29%.

Some studies find a significant positive relationship between lockdowns and mortality. This includes Chisadza et al. (2021), who find that stricter lockdowns (higher OxCGRT stringency index) increases COVID-19 mortality by 0.01 deaths/million per stringency point and Berry et al. (2021), who find that SIPOs increase COVID-19 mortality by 1% after 14 days.

Most studies use the number of official COVID-19 deaths as the dependent variable. Only one study, Bjørnskov (2021a), looks at total excess mortality which – although is not perfect – we perceive to be the best measure, as it overcomes the measurement problems related to properly reporting COVID-19 deaths.

Several studies explicitly claim that they estimate the actual causal relationship between lockdowns and COVID-19 mortality. Some studies use instrumental variables to justify the causality associated with their analysis, while others make causality probable using anecdotal evidence.²⁵ But, Sebhatu et al. (2020) show that government policies are strongly driven by the policies initiated in neighboring countries rather than by the severity of the pandemic in their own countries. In short, it is not the severity of the pandemic that drives the adoption of lockdowns, but rather the propensity to copy policies initiated by neighboring countries. The Sebhatu et al. conclusion throws into doubt the notion of a causal relationship between lockdowns and COVID-19 mortality.

Table 1: Summary of eligible studies

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
Alderman and Harjoto (2020); "COVID-19: U.S. shelter-in-place orders and demographic characteristics linked to cases, mortality, and recovery rates"	COVID-19 mortality	Use State-level data from the COVID-19 Tracking Project data all U.S. states, and a multivariate regression analysis to empirically investigate the impacts of the duration of shelter-in-place orders on mortality.	Find that shelter-in-place orders are - for the average duration - associated with 1% (insignificant) fewer deaths per capita.	
Aparicio and Grossbard (2021); "Are Covid Fatalities in the U.S. Higher than in the EU, and If so, Why?"	COVID-19 mortality	Their main focus is to explain the gap in COVID-19-fatalities between Europe and the United States based on COVID-deaths and other data from 85 nations/states. They include status for "social events" (ban on public gatherings, cancellation of major events and conferences), school closures, shop closures "partial lockdowns" (e.g. night curfew) and "lockdowns" (all-day curfew) 100 days after the pandemic onset in a country/state. None of these interventions have a significant effect on COVID-19 mortality. They also find no	Find no effect of "social events" (ban on public gatherings, cancellation of major events and conferences), school closures, shop closures "partial lockdowns" (e.g. night curfew) and "lockdowns" (all-day curfew) 100 days after the pandemic onset.	In the abstract the authors states that "various types of social distance measures such as school closings and lockdowns, and how soon they were implemented, help explain the U.S./EUROPE gap in cumulative deaths measured 100 days after the pandemic's onset in a state or country" although their estimates are insignificant.

²⁵ E.g. Dave et al. (2021) states that "estimated case reductions accelerate over time, becoming largest after 20 days following enactment of a SIPO. These findings are consistent with a causal interpretation."

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
		significant effect of early cancelling of social events, school closures, shop closures, partial lockdowns and full lockdowns.		
Ashraf (2020); "Socioeconomic conditions, government interventions and health outcomes during COVID-19"	COVID-19 mortality	Their main focus is on the effectiveness of policies targeted to diminish the effect of socioeconomic inequalities (economic support) on COVID-19-deaths. They use data from 80 countries worldwide and include the OxCGRT stringency as a control variable in their models. The paper finds a significant negative (fewer deaths) effect of stricter lockdowns. The effect of lockdowns is insignificant, when they include an interaction term between the socioeconomic conditions index and the economic support index in their model.	For each 1-unit increase in OxCGRT stringency index, the cumulative mortality changes by -0.326 deaths per million (fewer deaths). The estimate is -0.073 deaths per million but insignificant, when including an interaction term between the socioeconomic conditions index and the economic support index.	
Auger et al. (2020); "Association between statewide school closure and COVID-19 incidence and mortality in the U.S."	COVID-19 mortality	U.S. population-based observational study which uses interrupted time series analyses incorporating a lag period to allow for potential policy-associated changes to occur. To isolate the association of school closure with outcomes, state-level nonpharmaceutical interventions and attributes were included in negative binomial regression models. Models were used to derive the estimated absolute differences between schools that closed and schools that remained open. The main outcome of the study is COVID-19 daily incidence and mortality per 100000 residents.	State that they adjust for several factors (e.g percentage of state's population aged 15 years and 65 years, CDC's social vulnerability index, stay-at-home or shelter-in-place order, restaurant and bar closure, testing rate per 1000 residents etc.), but does not specify how and do not present estimates.	All 50 states closed schools between March 13, 2020, and March 23, 2020. Hence, all difference-in-difference is based on maximum 10 days, and given the long lag between infection and death, there is a risk that their approach is more an interrupted time series analysis, where they compare United States before and after school closures, rather than a true difference-in-difference approach. However, we choose to include the study in our review as it - objectively speaking - lives up to the eligibility criteria specified in our protocol.
Berry et al. (2021); "Evaluating the effects of shelter-in-place policies during the COVID-19 pandemic"	COVID-19 mortality	The authors use U.S. county data on COVID-19 deaths from Johns Hopkin and SIPO data from the University of Washington to estimate the effect of SIPO's. They find no detectable effects of SIPO on deaths. The authors stress that their findings should not be interpreted as evidence that social distancing behaviors are not effective. Many people had already changed their behaviors before the introduction of shelter-in-place orders, and shelter-in-place orders appear to have been ineffective precisely because they did not meaningfully alter social distancing behavior.	SIPO increases the number of deaths by 0,654 per million after 14 days (see Fig. 2)	The authors conclude that "We do not find detectable effects of these policies [SIPO] on disease spread or deaths." However, this statement does not correspond to their results. In figure 2 they show that the effect on deaths is significant after 14 days. Looks at the effect 14 days after SIPO's are implemented which is a short lag given that the time between infection and deaths is at least 2-3 weeks.
Bjørnskov (2021a); "Did Lockdown Work? An Economist's Cross-Country Comparison"	Excess mortality	Uses excess mortality and OxCGRT stringency from 24 European countries to estimate the effect of lockdown on the number of deaths one, two, three and four weeks later. Finds no effect (negative but insignificant) of (stricter) lockdowns. The author's specification using instrument variables yields similar results.	A stricter lockdown (OxCGRT stringency) does not have a significant effect on excess mortality.	Finds a positive (more deaths) effect after one and two weeks, which could indicate that other factors (omitted variables) affect the results.
Blanco et al. (2020); "Do Coronavirus Containment Measures Work? Worldwide Evidence"	COVID-19 mortality	Use data for deaths and NPIs from Hale et al. (2020) covering 158 countries between January and August 2020 to evaluate the effect of eight different NPIs (stay at home, bans on gatherings, bans on public	When using the naïve dummy variable approach, all parameters are statistically	Run the same model four times for each of the different NPIs (stay at home-orders, ban on meetings, ban on public events and mobility restrictions). These NPIs were often introduced almost simultaneously so there is a high risk of

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
		events, closing schools, lockdowns of workplaces, interruption of public transportation services, and international border closures. They address the possible endogeneity of the NPIs by using instrumental variables.	insignificant. On the contrary, estimates using the instrumental variable approach indicate that NPIs are effective in reducing the growth rate in the daily number of deaths 14 days later.	multicollinearity with each run capturing the same underlying effect. Indeed, the size and standard errors of the estimates are worryingly similar. Looks at the effect 14 days after NPIs are implemented which is a fairly short lag given the time between infection and deaths is 2-3 weeks, cf. e.g. Flaxman et al. (2020), which according to Bjørnskov (2020) appears to be the minimum typical time from infection to death).
Bonardi et al. (2020); "Fast and local: How did lockdown policies affect the spread and severity of the covid-19"	Growth rates	Use NPI data scraped from news headlines from LexisNexis and death data from Johns Hopkins University up to April 1st 2020 in a panel structure with 184 countries. Controls for country fixed effects, day fixed effects and within-country evolution of the disease.	Find that certain interventions (SIPO, regional lockdown and partial lockdown) work (in developed countries), but that stricter interventions (SIPO) do not have a larger effect than less strict interventions (e.g. restrictions on gatherings). Find no effect of border closures.	Find a positive (more deaths) effect on day 1 after lockdown which may indicate that their results are driven by other factors (omitted variables). We rely on their publicly available version submitted to CEPR Covid Economics, but estimates on the effect of deaths can be found in Supplementary material, which is available in an updated version hosted on the Danish Broadcasting Corporation's webpage: https://www.dr.dk/static/documents/2021/03/04/managing_pandemics_e3911c11.pdf
Bongaerts et al. (2021); "Closed for business: The mortality impact of business closures during the Covid-19 pandemic"	COVID-19 mortality	Uses variation in exposure to closed sectors (e.g. tourism) in municipalities within Italy to estimate the effect of business closures. Assuming that municipalities with different exposures to closed sectors are not inherently different, they find that municipalities with higher exposure to closed sectors experienced subsequently lower mortality rates.	Business shutdown saved 9,439 Italian lives by April 13th 2020. This corresponds to a reduction of deaths by 32%, as there were 20,465 COVID-19-deaths in Italy by mid April 2020.	They (implicitly) assume that municipalities with different exposures to closed sectors are not inherently different. This assumption could be problematic, as more touristed municipalities can be very different from e.g. more industrialized municipalities.
Chaudhry et al. (2020); "A country level analysis measuring the impact of government actions, country preparedness and socioeconomic factors on COVID-19 mortality and related health outcomes"	COVID-19 mortality	Uses information on COVID-19 related national policies and health outcomes from the top 50 countries ranked by number of cases. Finds no significant effect of any NPI on the number of COVID-19-deaths.	Finds no significant effect on mortality of any of the analyzed interventions (partial border closure, complete border closure, partial lockdown (physical distancing measures only), complete lockdown (enhanced containment measures including suspension of all non-essential services), and curfews).	
Chernozhukov et al. (2021); "Causal impact of masks, policies, behavior on early covid-19 pandemic in the U.S."	Growth rates	Uses COVID-deaths from the New York Times and Johns Hopkins and data for U.S. States from Raifman et al. (2020) to estimate the effect of SIPO, closed nonessential businesses, closed K-12 schools, closed restaurants except takeout, closed movie theaters, and face mask mandates for employees in public facing businesses.	Finds that mandatory masks for employees and closing K-12 schools reduces deaths. SIPO and closing business (average of closed businesses, restaurants and movie theaters) has no statistically significant effect. The effect of school closures is highly sensitive to the	States that "our regression specification for case and death growths is explicitly guided by a SIR model although our causal approach does not hinge on the validity of a SIR model." We are uncertain if this means that data are managed to fit an SIR-model (and thus should fail our eligibility criteria).

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
			inclusion of national case and death data.	
Chisadza et al. (2021); "Government Effectiveness and the COVID-19 Pandemic"	COVID-19 mortality	Uses COVID-19-deaths and OxCGRT stringency from 144 countries to estimate the effect of lockdown on the number of COVID-19-deaths. Find a significant positive (more deaths) non-linear association between government response indices and the number of deaths.	An increase by 1 on "stringency index" increases the number of deaths by 0.0130 per million. The sign of the squared term is negative, but the combined non-linear estimate is positive (increases deaths) and larger than the linear estimate for all values of the OxCGRT stringency index.	The author states that "less stringent interventions increase the number of deaths, whereas more severe responses to the pandemic can lower fatalities." However, according to their estimates this is not correct, as the combined non-linear estimate cannot be negative for relevant values of the OxCGRT stringency index (0 to 100).
Dave et al. (2021); "When Do Shelter-in-Place Orders Fight Covid-19 Best? Policy Heterogeneity Across States and Adoption Time"	COVID-19 mortality	Uses smartphone location tracking and state data on COVID-19 deaths and SIPO data (supplemented by their own searches) collected by the New York Times to estimate the effect of SIPO's. Finds that SIPO was associated with a 9%-10% increase in the rate at which state residents remained in their homes full-time, but overall they do not find a significant effect on mortality after 20+ days (see Figure 4). Indicate that the lacking significance may be due to long term estimates being identified of a few early adopting states.	Finds no overall significant effect of SIPO on deaths but does find a negative effect (fewer deaths) in early adopting states.	Find large effects of SIPO on deaths after 6-14 days in early adopting states (see Table 8), which is before an SIPO-related effect would be seen. This could indicate that other factors rather than SIPO's drive the results.
Dergiades et al. (2020); "Effectiveness of government policies in response to the COVID-19 outbreak"	COVID-19 mortality	Uses daily deaths from the European Centre for Disease Prevention and Control and OxCGRT stringency from 32 countries worldwide (including U.S.) to estimate the effect of lockdown on the number of deaths.	Finds that the greater the strength of government interventions at an early stage, the more effective these are in slowing down or reversing the growth rate of deaths.	Focus is on the effect of early stage NPIs and thus does not absolutely live up to our eligibility criteria. However, we include the study as it differentiates between lockdown strength at an early stage.
Fakir and Bharati (2021); "Pandemic catch-22: The role of mobility restrictions and institutional inequalities in halting the spread of COVID-19"	COVID-19 mortality	Uses data from 127 countries, combining high-frequency measures of mobility data from Google's daily mobility reports, country-date-level information on the stringency of restrictions in response to the pandemic from Oxford's Coronavirus Government Response Tracker (OxCGRT), and daily data on deaths attributed to COVID-19 from Our World In Data and the Johns Hopkins University. Instrument stringency using day-to-day changes in the stringency of the restrictions in the rest of the world.	Find large causal effects of stricter restrictions on the weekly growth rate of recorded deaths attributed to COVID-19. Show that more stringent interventions help more in richer, more educated, more democratic, and less corrupt countries with older, healthier populations and more effective governments.	Finds a larger effect on deaths after 0 days than after 14 and 21 days (Table 3). This is surprising given that it takes 2-3 weeks from infection to death, and it may indicate that their results are driven by other factors.
Fowler et al. (2021); "Stay-at-home orders associate with subsequent decreases in COVID-19 cases and fatalities in the United States"	COVID-19 mortality	Uses U.S. county data on COVID-19 deaths and SIPO data collected by the New York Times to estimate the effect of SIPO's using a two-way fixed-effects difference-in-differences model. Find a large and early (after few days) effect of SIPO on COVID-19 related deaths.	Stay-at-home orders are also associated with a 59.8 percent (18.3 to 80.2) average reduction in weekly fatalities after three weeks. These results suggest that stay-at-home orders	Finds the largest effect of SIPO on deaths after 10 days (see Figure 4), before a SIPO-related effect could possibly be seen as it takes 2-3 weeks from infection to death. This could indicate that other factors drive their results.

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
			might have reduced confirmed cases by 390,000 (170,000 to 680,000) and fatalities by 41,000 (27,000 to 59,000) within the first three weeks in localities that implemented stay-at-home orders.	
Fuller et al. (2021); "Mitigation Policies and COVID-19-Associated Mortality – 37 European Countries, January 23–June 30, 2020"	COVID-19 mortality	Uses COVID-19-deaths and OxCGRT stringency in 37 European countries to estimate the effect of lockdown on the number of COVID-19-deaths. Find a significant negative (fewer deaths) effect of stricter lockdowns after mortality threshold is reached (the threshold is a daily rate of 0.02 new COVID-19 deaths per 100,000 population (based on a 7-day moving average))	For each 1-unit increase in OxCGRT stringency index, the cumulative mortality decreases by 0.55 deaths per 100,000.	
Gibson (2020); "Government mandated lockdowns do not reduce Covid-19 deaths: implications for evaluating the stringent New Zealand response"	COVID-19 mortality	Uses data for every county in the United States from March through June 1, 2020, to estimate the effect of SIPO (called "lockdown") on COVID-19 mortality. Policy data are acquired from American Red Cross reporting on emergency regulations. His control variables include county population and density, the elder share, the share in nursing homes, nine other demographic and economic characteristics and a set of regional fixed effects. Handles causality problems using instrument variables (IV).	Find no statistically significant effect of SIPO.	Gibson use the word "lockdown" as synonym for SIPO (writes "technically, government-ordered community quarantine")
Goldstein et al. (2021); "Lockdown Fatigue: The Diminishing Effects of Quarantines on the Spread of COVID-19 "	COVID-19 mortality	Uses panel data from 152 countries with data from the onset of the pandemic until December 31, 2020. Finds that lockdowns tend to reduce the number of COVID-19 related deaths, but also that this benign impact declines over time: after four months of strict lockdown, NPIs have a significantly weaker contribution in terms of their effect in reducing COVID-19 related fatalities.	Stricter lockdowns reduce deaths for the first 60 days, whereafter the cumulative effect begins to decrease. If reintroduced after 120, the effect of lockdowns is smaller in the short run, but after 90 days the effect is almost the same as during first lockdown (only app. 10% lower).	There is little documentation in the study (e.g. no tables with estimates).
Guo et al. (2021); "Mitigation Interventions in the United States: An Exploratory Investigation of Determinants and Impacts"	COVID-19 mortality	Uses policy data from 1,470 executive orders from the state-government websites for all 50 states and Washington DC and COVID-19-deaths from Johns Hopkins University in a random-effect spatial error panel model to estimate the effect of nine NPIs (SIPO, strengthened SIPO, public school closure, all school closure, large-gathering ban of more than 10 people, any gathering ban, restaurant/bar limit to dining out only, nonessential business closure, and mandatory self-quarantine of travelers) on COVID-19 deaths.	Two mitigation strategies (all school closure and mandatory self-quarantine of travelers) showed positive (more deaths) impact on COVID-19-deaths per 10,000. Six mitigation strategies (SIPO, public school closure, large gathering bans (>10), any gathering ban, restaurant/bar limit to dining out only, and nonessential business	Only conclude on NPIs which reduce mortality. However, the conclusion is based on one-tailed tests, which means that all positive estimates (more deaths) are deemed insignificant. Thus, in their mortality-specification (Table 3, Proportion of Cumulative Deaths Over the Population), the estimate of all school closures (.204) and mandatory self-quarantine of travelers (0.363) is deemed insignificant based on schools CI [.029, .379] and quarantine CI [.193, .532]. We believe, these results should be interpreted as a significant increase in mortality, and that these results should have been part of their conclusion.

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
			closure) did not show any impact (Table 3, "Proportion of Cumulative Deaths Over the Population).	
Hale et al. (2020); "Global assessment of the relationship between government response measures and COVID-19 deaths"	COVID-19 mortality	Uses the OxCGRT stringency and COVID-19-deaths from the European Centre for Disease Prevention and Control for 170 countries. Estimates both cross-sectional models in which countries are the unit of analysis, as well as longitudinal models on time-series panel data with country-day as the unit of analysis (including models that use both time and country fixed effects).	Finds that higher stringency in the past leads to a lower growth rate in the present, with each additional point of stringency corresponding to a 0.039%-point reduction in daily deaths growth rates six weeks later.	
Hunter et al. (2021); "Impact of non-pharmaceutical interventions against COVID-19 in Europe: A quasi-experimental non-equivalent group and time-series"	COVID-19 mortality	Uses death data from the European Centre for Disease Prevention and Control (ECDC) and NPI-data from the Institute of Health Metrics and Evaluation. Argues that they use a quasi-experimental approach to identify the effect of NPIs because no analyzed intervention was imposed by all European countries and interventions were put in place at different points in the development of the epidemics.	Finds that mass gathering restrictions and initial business closures (businesses such as entertainment venues, bars and restaurants) reduces the number of deaths, whereas closing educational facilities and issuing SIPO increases the number of deaths. Finds no effect of closing non-essential services and mandating/recommending masks (Table 3)	Finds an effect of closing educational facilities and non-essential services after 1-7 days before lockdown could possibly have an effect on the number of deaths. This may indicate that other factors are driving their results.
Langeland et al. (2021); "The Effect of State Level COVID-19 Stay-at-Home Orders on Death Rates"	COVID-19 mortality	Estimates the effect of state-level lockdowns on COVID-19 deaths using multiple quasi-Poisson regressions with lockdown time length as the explanatory variable. Does not specify how lockdown is defined and what their data sources are.	Finds no significant effect of SIPO on the number of deaths after 2-4, 4-6 and 6+ weeks.	They write that "6+ weeks of lockdown is the only setting where the odds of dying are statistically higher than in the no lockdown case." However, all estimates are insignificant in Table C. Looks as if lockdown duration may cause a causality problem, because politicians may be less likely to ease restrictions when there are many cases/deaths.
Leffler et al. (2020); "Association of country-wide coronavirus mortality with demographics, testing, lockdowns, and public wearing of masks"	COVID-19 mortality	Use COVID-19 deaths from Worldometer and info about NPIs (mask/mask recommendations, international travel restrictions and lockdowns (defined as any closure of schools or workplaces, limits on public gatherings or internal movement, or stay-at-home orders) from Hale et al. (2020) for 200 countries to estimate the effect of the duration of NPIs on the number of deaths.	Finds that masking (mask recommendations) reduces mortality. For each week that masks were recommended the increase in per-capita mortality was 8.1% (compared to 55.7% increase when masks were not recommended). Finds no significant effect of the number of weeks with internal lockdowns and international travel restrictions (Table 2).	Their "mask recommendation" category includes some countries, where masks were mandated (see Supplemental Table A1) and may (partially) capture the effect of mask mandates. Looks at duration which may cause a causality problem, because politicians may be less likely to ease restrictions when there are many cases/deaths.
Mccafferty and Ashley (2021); "Covid-19 Social Distancing Interventions by Statutory Mandate and Their Observational	Other	Use data from 27 U.S. states and 12 European countries to analyze the effect of NPIs on peak mortality rate using general linear mixed effects modelling.	Finds that no mandate (school closures, prohibition on mass gatherings, business closures, stay at home	

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
Correlation to Mortality in the United States and Europe"			orders, severe travel restrictions, and closure of non-essential businesses) was effective in reducing the peak COVID-19 mortality rate.	
Pan et al. (2020); "Covid-19: Effectiveness of non-pharmaceutical interventions in the united states before phased removal of social distancing protections varies by region"	COVID-19 mortality	Uses county-level data for all U.S. states. Mortality is obtained from Johns Hopkins, while policy data are obtained from official governmental websites. Categorizes 12 policies into 4 levels of disease control; Level 1 (low) - State of Emergency; Level 2 (moderate) - school closures, restricting access (visits) to nursing homes, or closing restaurants and bars; Level 3 (high) - non-essential business closures, suspending non-violent arrests, suspending elective medical procedures, suspending evictions, or restricting mass gatherings of at least 10 people; and Level 4 (aggressive) - sheltering in place / stay-at-home, public mask requirements, or travel restrictions. Use stepped-wedge cluster randomized trial (SW-CRT) for clustering and negative binomial mixed model regression.	Concludes that only (duration of, see comment in next column) level 4 restrictions are associated with reduced risk of death, with an average 15% decline in the COVID-19 death rate per day. Implementation of level 3 and level 2 restrictions increased death rates in 6 of 6 regions, while longer duration increased death rates in 5 of 6 regions.	They focus on the negative estimate of duration of Level 4. However, their implementation estimate is large and positive, and the combined effect of implementation and duration is unclear.
Pincombe et al. (2021); "The effectiveness of national-level containment and closure policies across income levels during the COVID-19 pandemic: an analysis of 113 countries"	COVID-19 mortality	Uses daily data for 113 countries on cumulative COVID-19 death counts over 130 days between February 15, 2020, and June 23, 2020, to examine changes in mortality growth rates across the World Bank's income group classifications following shelter-in-place recommendations or orders (they use one variable covering both recommendations and orders).	Finds that shelter-in-place recommendations/orders reduces mortality growth rates in high income countries (although insignificant) but increases growth rates in countries in other income groups.	
Sears et al. (2020); "Are we #stayinghome to Flatten the Curve?"	COVID-19 mortality	Uses cellular location data from all 50 states and the District of Columbia to investigate mobility patterns during the pandemic across states and time. Adding COVID-19 death tolls and the timing of SIPO for each state they estimate the effect of stay-at-home policies on COVID-19 mortality.	Find that SIPOs lower deaths by 0.13- 0.17 per 100,000 residents, equivalent to death rates 29-35% lower than in the absence of policies. However, these estimates are insignificant at a 95% confidence interval (see Table 4). The study also finds reductions in activity levels prior to mandates. Human encounter rate fell by 63 percentage points and nonessential visits by 39 percentage points relative to pre-COVID-19 levels, prior to any state implementing a statewide mandate	In the abstract the authors state that death rates would be 42-54% lower than in the absence of policies. However, this includes averted deaths due to pre-mandate social distancing behavior (p. 6). The effect of SIPO is a reduction in deaths by 29%-35% compared to a situation without SIPO but with pre-mandate social distancing. These estimates are insignificant at a 95% confidence interval.

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
Shiva and Molana (2021); "The Luxury of Lockdown"	COVID-19 mortality	Uses COVID-19-deaths and OxCGRT stringency from 169 countries to estimate the effect of lockdown on the number of deaths 1-8 weeks later. Finds that stricter lockdowns reduce COVID-19-deaths 4 weeks later (but insignificant 8 weeks later) and have the greatest effect in high income countries. Finds no effect of workplace closures in low-income countries.	A stricter lockdown (1 stringency point) reduces deaths by 0,1% after 4 weeks. After 8 weeks the effect is insignificant.	
Spiegel and Tookes (2021); "Business restrictions and Covid-19 fatalities"	COVID-19 mortality	Use data for every county in the United States from March through December 2020 to estimate the effect of various NPIs on the COVID-19-deaths growth rate. Derives causality by 1) assuming that state regulators primarily focus on the state's most populous counties, so state regulation in smaller counties can be viewed as a quasi randomized experiment, and 2) conducting county pair analysis, where similar counties in different states (and subject to different state policies) are compared.	Finds that some interventions (e.g. mask mandates, restaurant and bar closures, gym closures, and high-risk business closures) reduces mortality growth, while other interventions (closures of low- to medium-risk businesses and personal care/spa services) did not have an effect and may even have increased the number of deaths.	In total they analyze the lockdown effect of 21 variables. 14 of 21 estimates are significant, and of these 6 are negative (reduces deaths) while 8 are positive (increases deaths). Some results are far from intuitive. E.g. mask recommendations increases deaths by 48% while mask mandates reduces deaths by 12%, and closing restaurants and bars reduces deaths by 50%, while closing bars but not restaurants only reduces deaths by 5%.
Stockenhuber (2020); "Did We Respond Quickly Enough? How Policy-Implementation Speed in Response to COVID-19 Affects the Number of Fatal Cases in Europe"	COVID-19 mortality	Uses data for the number of COVID-19 infections and deaths and policy information for 24 countries from OxCGRT to estimate the effect of stricter lockdowns on the number of deaths using principal component analysis and a generalized linear mixed model.	Finds no significant effect of stricter lockdowns on the number of fatalities (Table 4).	Groups data on lockdown strictness into four groups and lose significant information and variation.
Stokes et al. (2020); "The relative effects of non-pharmaceutical interventions on early Covid-19 mortality: natural experiment in 130 countries"	COVID-19 mortality	Uses daily Covid-19 deaths for 130 countries from the European Centre for Disease Prevention and Control (ECDC) and daily policy data from the Oxford COVID-19 Government Response Tracker (OxCGRT). Looks at all levels of restrictions for each of the nine sub-categories of the OxCGRT stringency index (school, work, events, gatherings, transport, SIPO, internal movement, travel).	Of the nine sub-categories in the OxCGRT stringency index, only travel restrictions are consistently significant (with level 2 "Quarantine arrivals from high-risk regions" having the largest effect, and the strictest level 4 "Total border closure" having the smallest effect). Restrictions on very large gatherings (>1,000) has a large significant negative (fewer deaths) effect, while the effect of stricter restrictions on gatherings are insignificant. Authors recommend that the closing of schools (level 1) has a very large (in absolute terms it's twice the effect of border quarantines) positive	Their results are counter intuitive and somewhat inconclusive. Why does limiting very large gatherings (>1,000) work, while stricter limits do not? Why do recommending school closures cause more deaths? Why is the effect of border closures before 1st death insignificant, while the effect of closing borders after 1st death is significant (and large)? And why does quarantining arrivals from high-risk regions work better than total border closures? With 23 estimated parameters in total these counter intuitive and inconclusive results could be caused by multiple test bias (we correct for this in the meta-analysis), but may also be caused by other factors such as omitted variable bias.

1. Study (Author & title)	2. Measure	3. Description	4. Results	5. Comments
			effect (more deaths) while stricter interventions on schools have no significant effect. Required cancelling of public events also has a significant positive (more deaths) effect. We focus on their 14-38 days results, as they catch the longest time frame (their 0-24 day model returns mostly insignificant results).	
Toya and Skidmore (2020); "A Cross-Country Analysis of the Determinants of Covid-19 Fatalities"	COVID-19 mortality	Uses COVID-19-deaths and lockdown info from various sources from 159 countries in a cross-country event study. Controls for country specifics by including socio-economic, political, geographic, and policy information. Finds little evidence for the efficacy of NPIs.	Complete travel restrictions prior to April 2020 reduced deaths by -0.226 per 100,000 by April 1st 2021, while mandatory national lockdown prior to April 2020 increased deaths by 0.166 by April 1st 2021. Recommended local lockdowns reduced deaths but results are based on one observation. Partial travel restrictions, mandatory local lockdowns and recommended national lockdowns did not have a significant effect on deaths.	The study looks at the lockdown status prior to April 2020 and the effect on deaths the following year (until April 1st 2021). The authors state this is to reduce concerns about endogeneity but do not explain why the lockdowns in the spring of 2020 are a good instrument for lockdowns during later waves are.
Tsai et al. (2021); "Coronavirus Disease 2019 (COVID-19) Transmission in the United States Before Versus After Relaxation of Statewide Social Distancing Measures"	Reproduction rate, Rt	Uses data for NPIs that were implemented and/or relaxed in U.S. states between 10 March and 15 July 2020. Using segmented linear regression, they estimate the extent to which relaxation of social distancing affected epidemic control, as indicated by the time-varying, state-specific effective reproduction number (Rt). Rt is based on death tolls.	Finds that in the 8 weeks prior to relaxing NPIs, Rt was declining, while after relaxation Rt started to increase.	Their Figure 1 shows that Rt on average increases app. 10 days before relaxation, which could indicate that other factors (omitted variables) affect the results.

Note: All comments on the significance of estimates are based on a 5% significance level unless otherwise stated.

It is difficult to make a conclusion based on the overview in Table 1. Is -0.073 to -0.326 deaths/million per stringency point, as estimated by Ashraf (2020), a large or a small effect relative to. the 98% reduction in mortality predicted by the study published by the Imperial College London (Ferguson et al. (2020)). This is the subject for our meta-analysis in the next section. Here, it turns out that -0.073 to -0.326 deaths/million per stringency point is a relatively modest effect and only corresponds to a 2.4% reduction in COVID-19 mortality on average in the U.S. and Europe.

4 Meta-analysis: The impact of lockdowns on COVID-19 mortality

We now turn to the meta-analysis, where we focus on the impact of lockdowns on COVID-19 mortality.

In the meta-analysis, we include 24 studies in which we can derive the relative effect of lockdowns on COVID-19 mortality, where mortality is measured as COVID-19-related deaths per million. In practice, this means that the studies we included estimate the effect of lockdowns on mortality or the effect of lockdowns on mortality growth rates, while using a counterfactual estimate.²⁶

Our focus is on the effect of compulsory non-pharmaceutical interventions (NPI), policies that restrict internal movement, close schools and businesses, and ban international travel, among others. We do not look at the effect of voluntary behavioral changes (e.g. voluntary mask wearing), the effect of recommendations (e.g. recommended mask wearing), or governmental services (voluntary mass testing and public information campaigns), but only on mandated NPIs.

The studies we examine are placed in three categories. Seven studies analyze the effect of stricter lockdowns based on the OxCGRT stringency indices, 13 studies analyze the effect of SIPOs (6 studies only analyze SIPOs, while seven analyze SIPOs among other interventions), and 11 studies analyze the effect of specific NPIs independently (lockdown vs. no lockdown).²⁷ Each of these categories is handled so that comparable estimates can be made across categories. Below, we present the results for each category and show the overall results, as well as those based on various quality dimensions.

Quality dimensions

We include quality dimensions because there are reasons to believe that can affect a study's conclusion. Below we describe the dimensions, as well as our reasons to believe that they are necessary to fully understand the empirical evidence.

- *Peer-reviewed vs. working papers:* We distinguish between peer-reviewed studies and working papers as we consider peer-reviewed studies generally being of higher quality than working papers.²⁸
- *Long vs. short time period:* We distinguish between studies based on long time periods (with data series ending *after* May 31, 2020) and short time periods (data series ending at or before May 31, 2020), because the first wave did not fully end before late June in the U.S. and Europe. Thus, studies relying on short data periods lack the last part of the first wave and may yield biased results if lockdowns only “flatten the curve” and do not prevent deaths.

²⁶ As a minimum requirement, one needs to know the effect on the top of the curve.

²⁷ The total is larger than 21 because the 11 SIPO studies include seven studies which look at multiple measures.

²⁸ Vetted papers from CEPR Covid Economics are considered as working papers in this regard.

- *No early effect on mortality*: On average, it takes approximately three weeks from infection to death.²⁹ However, several studies find effects of lockdown on mortality almost immediately. Fowler et al. (2021) find a significant effect of SIPOs on mortality after just four days and the largest effect after 10 days. An early effect may indicate that other factors (omitted variables) drive the results, and, thus, we distinguish between studies which find an effect on mortality sooner than 14 days after lockdown and those that do not.³⁰ Note that many studies do not look at the short term and thus fall into the latter category by default.
- *Social sciences vs. other sciences*: While it is true that epidemiologists and researchers in natural sciences should, in principle, know much more about COVID-19 and how it spreads than social scientists, social scientists are, in principle, experts in evaluating the effect of various policy interventions. Thus, we distinguish between studies published by scholars in social sciences and by scholars from other fields of research. We perceive the former as being better suited for examining the effects of lockdowns on mortality. For each study, we have registered the research field for the corresponding author's associated institute (e.g., for a scholar from "Institute of economics" research field is registered as "Economics"). Where no corresponding author was available, the first author has been used. Afterwards, all research fields have been classified as either from the "Social Science" or "Other."³¹

We also considered including a quality dimension to distinguish between studies based on excess mortality and studies based on COVID-19 mortality, as we believe that excess mortality is potentially a better measure for two reasons. First, data on total deaths in a country is far more precise than data on COVID-19 related deaths, which may be both underreported (due to lack of tests) or overreported (because some people die *with* – but not *because of* – COVID-19). Secondly, a major purpose of lockdowns is to save lives. To the extent lockdowns shift deaths *from* COVID-19 *to* other causes (e.g. suicide), estimates based on COVID-19 mortality will overestimate the effect of lockdowns. Likewise, if lockdowns save lives in other ways (e.g. fewer traffic accidents) lockdowns' effect on mortality will be underestimated. However, as only one

²⁹ Leffler et al. (2020) writes, "On average, the time from infection with the coronavirus to onset of symptoms is 5.1 days, and the time from symptom onset to death is on average 17.8 days. Therefore, the time from infection to death is expected to be 23 days." Meanwhile, Stokes et al. (2020) writes that "evidence suggests a mean lag between virus transmission and symptom onset of 6 days, and a further mean lag of 18 days between onset of symptoms and death."

³⁰ Some of the authors are aware of this problem. E.g. Bjørnskov (2021a) writes "when the lag length extends to three or four weeks, that is, the length that is reasonable from the perspective of the virology of Sars-CoV-2, the estimates become very small and insignificant" and "these results confirm the overall pattern by being negative and significant when lagged one or two weeks (the period when they cannot have worked) but turning positive and insignificant when lagged four weeks."

³¹ Research fields classified as social sciences were economics, public health, management, political science, government, international development, and public policy, while research fields not classified as social sciences were ophthalmology, environment, medicine, evolutionary biology and environment, human toxicology, epidemiology, and anesthesiology.

of the 34 studies (Bjørnskov (2021a)) is based on excess mortality, we are unfortunately forced to disregard this quality dimension.

Meta-data used for our quality dimensions as well as other relevant information are shown in Table 2.

Table 2: Metadata for the studies included in the meta-analysis

1. Study (Author & title)	2. Included in meta-analysis	3. Publication status	4. End of data period	5. Earliest effect	6. Field of research	7. Lockdown measure	8. Geographical coverage
Alderman and Harjoto (2020); "COVID-19: U.S. shelter-in-place orders and demographic characteristics linked to cases, mortality, and recovery rates"	Yes	Peer-review	11-Jun-20	n/a	Economics (Social science)	SIPO	United States

Interpreting and weighting estimates

The estimates used in the meta-analysis are not always readily available in the studies shown in Table 2. In Appendix B Table 9, we describe for each paper how we interpret the estimates and how they are converted to a common estimate (the relative effect of lockdowns on COVID-19 mortality) which is comparable across all studies.

Following Paldam (2015) and Stanley and Doucouliagos (2010), we also convert standard errors³² and use the precision of each estimate (defined as $1/SE$) to calculate the precision-weighted average of all estimates and present funnel plots. The precision-weighted average is our primary indicator of the efficacy of lockdowns, but we also report arithmetic averages and medians in the meta-analysis.

In the following sections, we present the meta-analysis for each of the three groups of studies (stringency index-studies, SIPO-studies, and studies analyzing specific NPIs).

4.1 Stringency index studies

Seven eligible studies examine the link between lockdown stringency and COVID-19 mortality. The results from these studies, converted to common estimates, are presented in Table 3 below. All studies are based on the COVID-19 Government Response Tracker's (OxCGRT) stringency index of Oxford University's Blavatnik School of Government (Hale et al. (2020)).

The OxCGRT stringency index neither measures the expected effectiveness of the lockdowns nor the expected costs. Instead, it describes the stringency based on nine equally weighted parameters.³³ Many countries followed similar patterns and almost all countries closed schools,

³² Standard errors are converted such that the t-value, calculated based on common estimates and standard errors, is unchanged. When confidence intervals are reported rather than standard errors, we calculate standard errors using t-distribution with ∞ degrees of freedom (i.e. 1.96 for 95% confidence interval).

³³ The nine parameters are "C1 School closing," "C2 Workplace closing," "C3 Cancel public events," "C4 Restrictions on gatherings," "C5 Close public transport," "C6 Stay at home requirements," "C7 Restrictions on internal movement," "C8 International travel controls" and "H1 Public information campaigns." The latter, "H1

while only a few countries issued SIPOs without closing businesses. Hence, it is reasonable to perceive the stringency index as continuous, although not necessarily linear. The index includes recommendations (e.g. “workplace closing” is 1 if the government recommends closing (or work from home), cf. Hale et al. (2021)), but the effect of including recommendations in the index is primarily to shift the index parallelly upward and should not alter the results relative to our focus on mandated NPIs. It is important to note that the index is not perfect. As pointed out by Book (2020), it is certainly possible to identify errors and omissions in the index. However, the index is objective and unbiased and as such, useful for cross-sectional analysis with several observations, even if not suitable for comparing the overall strictness of lockdowns in two countries.

Since the studies examined use different units of estimates, we have created common estimates for Europe and United States to make them comparable. The common estimates show the effect of the average lockdown in Europe and United States (with average stringencies of 76 and 74, respectively, between March 16th and April 15th, 2020, compared to a policy based solely on recommendations (stringency 44)). For example, Ashraf (2020) estimates that the effect of stricter lockdowns is -0.073 to -0.326 deaths/million per stringency point. We use the average of these two estimates (-0.200) in the meta-analysis (see Table 9 in Appendix B for a description for all studies). The average lockdown in Europe between March 16th and April 15th, 2020, was 32 points stricter than a policy solely based on recommendations (76 vs. 44). In United States, it was 30 points. Hence, the total effect of the lockdowns compared to the recommendation policy was -6.37 deaths/million in Europe (32 x -0.200) and -5.91 deaths/million in United States. With populations of 748 million and 333 million, respectively the total effect as estimated by Ashraf (2020) is 4,766 averted COVID-19 deaths in Europe and 1,969 averted COVID-19 deaths in United States. By the end of the study period in Ashraf (2020), which is May 20, 2020, 164,600 people in Europe and 97,081 people in the United States had died of COVID-19. Hence, the 4,766 averted COVID-19 deaths in Europe and the 1,969 averted COVID-19 deaths in the United States corresponds to 2.8% and 2.0% of all COVID-19 deaths, respectively, with an arithmetic average of 2.4%. Our common estimate is thus -2.4%, cf. Table 3. So, this means that Ashraf (2020) estimates that without lockdowns, COVID-19 deaths in Europe would have been 169,366 and COVID-19 deaths in the U.S. would have been 99,050. Our approach is not unproblematic. First of all, the level of stringency varies over time for all countries. We use the stringency between March 16th and April 15th, 2020 because this period covers the main part of the first wave which most of the studies analyze. Secondly, OxCGRT has changed the index over time and a 10-point difference today may not be exactly the same as a 10-point difference when the studies were finalized. However, we believe these problems are unlikely to significantly alter our results.

Public information campaigns,” is not an intervention following our definition, as it is not a mandatory requirement. However, of 97 European countries and U.S. States in the OxCGRT database, only Andorra, Belarus, Bosnia and Herzegovina, Faeroe Islands, and Moldova – less than 1.6% of the population – did not get the maximum score by March 20, 2020, so the parameter simply shifts the index parallelly upward and should not have notable impact on the analyzes.

Table 3 demonstrates that the studies find that lockdowns, on average, have reduced COVID-19 mortality rates by 0.2% (precision-weighted). The results yield a median of -2.4% and an arithmetic average of -7.3%. Only one of the seven studies, Fuller et al. (2021), finds a significant *and* (relative to the effect predicted in studies like Ferguson et al. (2020)) substantial effect of lockdowns (-35%). The other six studies find much smaller effects. Hence, based on the stringency index studies, we find little to no evidence that mandated lockdowns in Europe and the United States had a noticeable effect on COVID-19 mortality rates. And, as will be discussed in the next paragraph, the fifth column of Table 3 displays the number of quality dimensions (out of 4) met by each study.

Table 3: Overview of common estimates from studies based on stringency indexes

Effect on COVID-19 mortality	Estimate (Estimated Averted Deaths / Total Deaths)	Standard error	Weight (1/SE)	Quality dimension s
Bjørnskov (2021)	-0.3%	0.8%	119	3
Shiva and Molana (2021)	-4.1%	0.4%	248	4
Stockenhuber (2020)*	0.0%	n/a	n/a	3
Chisadza et al. (2021)	0.1%	0.0%	7,390	4
Goldstein et al. (2021)	-9.0%	3.8%	26	2
Fuller et al. (2021)	-35.3%	9.1%	11	2
Ashraf (2020)	-2.4%	0.4%	256	2
Precision-weighted average (arithmetic average / median)	-0.2% (-7.3% / -2.4%)			

Note: The table shows the estimates for each study converted to a common estimate, i.e. the implied effect on COVID-19 mortality in Europe and United States. A negative number corresponds to fewer deaths, so -5% means 5% lower COVID-19 mortality. For studies which report estimates in deaths per million, the common estimate is calculated as: (COVID-19 mortality with "common area's" policy) / (COVID-19 mortality with recommendation policy) - 1, where (COVID-19 mortality with recommendation policy) is calculated as ((COVID-19 mortality with "common area's" policy) - Estimate x Difference in stringency x population). Stringencies in Europe and United States are equal to the average stringency from March 16th to April 15th 2020 (76 and 74 respectively) and the stringency for the policy based solely on recommendations is 44 following Hale et al. (2020). For the conversion of other studies see Table 9 in appendix B.

** It is not possible to calculate a common estimate for Stockenhuber (2020). When calculating arithmetic average / median, the study is included as 0%, because estimates are insignificant and signs of estimates are mixed (higher strictness can cause both lower and higher COVID-19 mortality).*

We now turn to the quality dimensions. Table 4 presents the results differentiated by the four quality dimensions. Two studies, Shiva and Molana (2021) and Chisadza et al. (2021), meet all quality dimensions. The precision-weighted average for these studies is 0.0%, meaning that lockdowns had no effect on COVID-19 mortality. Two studies live up to 3 of 4 quality dimensions (Bjørnskov (2021a) and Stockenhuber (2020)). The precision-weighted average for these studies is -0.3%, meaning that lockdowns reduced COVID-19 mortality by 0.3%. Three studies lack at least two quality dimensions.³⁴ These studies find that lockdowns reduce COVID-19 mortality by 4.2%. To sum up, we find that the studies that meet at least 3 of 4 quality measures find that lockdowns have little to no effect on COVID-19 mortality, while studies that

³⁴ In fact, the working papers by P. Goldstein et al. (2021), Fuller et al. (2021) and Ashraf (2020) all lack exactly two quality parameters.

meet 2 of 4 quality measures find a small effect on COVID-19 mortality. These results are far from those estimated with the use of epidemiological models, such as the Imperial College London (Ferguson et al. (2020)).

Table 4: Overview of common estimates split on quality dimensions for studies based on stringency indexes

<i>Values show effect on COVID-19 mortality</i>	Precision-weighted average*	Arithmetic average	Median
Peer-reviewed vs. working papers			
Peer-reviewed [4]	0.0%	-1.1%	-0.2%
Working paper [3]	-4.2%	-15.6%	-9.0%
Long vs. short time period			
Data series ends after 31 May 2020 [6]	-0.1%	-8.1%	-0.2%
Data series ends before 31 May 2020 [1]	-2.4%	-2.4%	-9.0%
No early effect on mortality			
Does not find an effect within the first 14 days (including n/a) [5]	-0.2%	-8.3%	-2.4%
Finds effect within the first 14 days [2]	-1.9%	-4.7%	-4.7%
Social sciences vs. other sciences			
Social sciences [5]	-0.1%	-3.1%	-2.4%
Other sciences [2]	-35.3%	-17.7%	-17.7%
4 of 4 quality dimensions [2]	0.0%	-2.0%	-2.0%
3 of 4 quality dimensions [2]	-0.3%	-0.2%	-0.2%
2 of 4 quality dimensions or fewer [3]	-4.2%	-15.6%	-9.0%

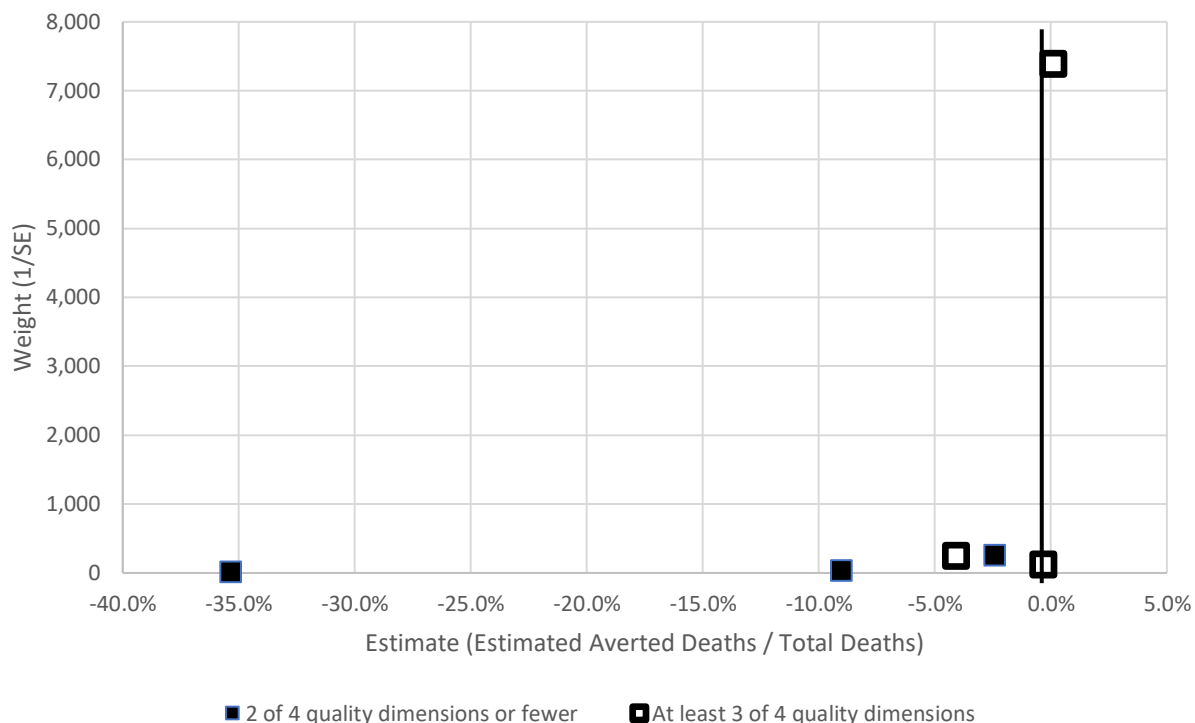

*Note: The table shows the common estimate as described in Table 3 for each quality dimension. The number of studies in each category is in square brackets. * The precision-weighted average does not include studies where no common standard error is available, cf. Table 3.*

Figure 5 shows a funnel plot for the studies in Table 3, except Stockenhuber (2020), where common estimate standard errors cannot be derived. Chisadza et al. (2021) has a far higher precision than the other studies ($1/SE$ is 7,398 and the estimate is 0.1%)³⁵, and there are indications that the estimate from Fuller et al. (2021) (the bottom left) is an imprecise outlier.³⁶ Figure 5 The plot also shows that the studies with at least 3 of 4 quality dimensions are centered around zero and generally have higher precision than other studies.

³⁵ Excluding Chisadza et al. (2021) from the precision-weighted average changes the average to -3.5%.

³⁶ Excluding Fuller et al. (2021) from the precision-weighted average only marginally changes the average because the precision is very low.

Figure 5: Funnel plot for estimates from studies based on stringency indexes

Note: The figure displays all estimates and the precision of the estimate defined as one over the standard error. Studies where standard errors are not available are not included. Studies which live up to at least 3 of 4 quality dimensions are marked with white, while studies which lives up to 2 of 3 quality dimensions or less are marked with black. The vertical line illustrates the precision-weighted average.

Overall conclusion on stringency index studies

Compared to a policy based solely on recommendations, we find little evidence that lockdowns had a noticeable impact on COVID-19 mortality. Only one study, Fuller et al. (2021), finds a substantial effect, while the rest of the studies find little to no effect. Indeed, according to stringency index studies, lockdowns in Europe and the United States reduced only COVID-19 mortality by 0.2% on average.

In the following section we will look at the effect of SIPOs. The section follows the same structure as this section.

4.2 Shelter-in-place order (SIPO) studies

We have identified 13 eligible studies which estimate the effect of Shelter-In-Place Orders (SIPOs) on COVID-19 mortality, cf. Table 5. Seven of these studies look at multiple NPIs of which a SIPO is just one, while six studies estimate the effect of a SIPO vs. no SIPO in the United States. According to the containment and closure policy indicators from OxCGRT, 41 states in the U.S. issued SIPOs in the spring of 2020. But usually, these were introduced after implementing other NPIs such as school closures or workplace closures. On average, SIPOs

were issued 7½ days after *both* schools and workplaces closed, and 12 days after the first of the two closed. Only one state, Tennessee, issued a SIPO before schools and workplaces closed. The 10 states that did not issue SIPOs all closed schools. Moreover, of those 10 states, three closed some non-essential businesses, while the remaining 7 closed all non-essential businesses. Because of this, we perceive estimates for SIPOs based on U.S.-data as the marginal effect of SIPOs on top of other restrictions, although we acknowledge that the estimates may capture the effects of other NPI measures as well.

The results of eligible studies based on SIPOs are presented in Table 5. The table demonstrates that the studies generally find that SIPOs have reduced COVID-19 mortality by 2.9% (on a precision-weighted average). There is an apparent difference between studies in which a SIPO is one of multiple NPIs, and studies in which a SIPO is the only examined intervention. The former group generally finds that SIPOs *increase* COVID-19 mortality *marginally*, whereas the latter finds that SIPOs *decrease* COVID-19 mortality. As we will see below, this difference could be explained by differences in the quality dimensions, and especially the time period covered by each study.

Table 5: Overview of estimates from studies based on SIPOs

<i>Values show effect on COVID-19 mortality</i>	Estimate (Estimated Averted Deaths / Total Deaths)	Standard error	Weight (1/SE)	Quality dimensions
Studies where SIPO is one of several examined interventions and not (as) likely to capture the effect of other interventions				
Chernozhukov et al. (2021)	-17.7%	14.3%	7	4
Chaudhry et al. (2020) *	0.0%	n/a	n/a	2
Aparicio and Grossbard (2021)	2.6%	2.8%	35	4
Stokes et al. (2020)	0.8%	11.1%	9	3
Spiegel and Tookes (2021)	13.1%	6.6%	15	3
Bonardi et al. (2020)	0.0%	n/a	n/a	1
Guo et al. (2021)	4.6%	14.8%	4	3
Average (median) where SIPO is one of several variables	2.8% (0.5%/0.8%)			
Studies where SIPO is the only examined intervention and may capture the effect of other interventions				
Sears et al. (2020)	-32.2%	17.6%	6	2
Alderman and Harjoto (2020)	-1.0%	0.6%	169	4
Berry et al. (2020)	1.1%	n/a	n/a	2
Fowler et al. (2021)	-35.0%	7.0%	14	2
Gibson (2020)	-6.0%	24.3%	4	4
Dave et al. (2020)	-40.8%	36.1%	3	3
Average (median) where SIPO is the only variable	-5.1% (-19.0%/-19.1%)			
Precision-weighted average (arithmetic average / median) for all studies	-2.9% (-8.5%/0.0%)			

Note: * Chaudhry et al. (2020) does not provide an estimate but states that SIPO is insignificant. We use 0% when calculating the arithmetic average and median. Chaudhry et al. (2020) and Berry et al. (2021) do not affect the precision-weighted average, as we do not know the standard errors.

Table 6 presents the results differentiated by quality dimensions. Four studies (Chernozhukov et al. (2021), Aparicio and Grossbard (2021), Alderman and Harjoto (2020) and Gibson (2020))

meet all quality dimensions but find vastly different effects of SIPOs on COVID-19 mortality. The precision weighted average of the four studies is -1.0%. Four studies meet 3 of 4 quality dimensions. They overall find that SIPOs *increase* COVID-19 mortality, as the precision-weighted average is positive (3.7%). The five studies that meet 2 of 4 quality dimensions or fewer³⁷ find a substantial reduction in COVID-19-mortality (-34.2%). This substantial reduction seems to be driven by relatively short data series. The latest data point for the three studies which find large effects of lockdowns (Sears et al. (2020), Fowler et al. (2021), and Dave et al. (2021)) are April 29, May 7, and April 20, respectively. This may indicate that SIPOs can delay deaths but not eliminate them completely. Disregarding these studies with short data series, the precision-weighted average is -0.1%.

Table 6: Quality dimensions for studies based on SIPOs

<i>Values show effect on COVID-19 mortality</i>	Precision-weighted average*	Arithmetic average	Median
Peer-reviewed vs. working papers			
Peer-review [10]	-2.4%	-7.9%	-0.5%
Working paper [3]	-12.0%	-10.5%	0.0%
Long vs. short time period			
Data serie ends after 31 May 2020 [6]	-0.1%	-1.4%	-0.1%
Data serie ends before 31 May 2020 [7]	-25.9%	-14.6%	0.0%
No early effect on mortality			
Finds effect within the first 14 days [9]	-2.0%	-10.0%	-1.0%
Does not find an effect within the first 14 days (including n/a) [4]	-10.3%	-5.2%	0.0%
Social sciences vs. other sciences			
Social sciences [12]	-2.9%	-9.2%	-0.5%
Other sciences [1]	n/a	0.0%	0.0%
4 of 4 quality dimensions [4]	-1.0%	-5.5%	-3.5%
3 of 4 quality dimensions [4]	3.7%	-5.6%	2.7%
2 of 4 quality dimensions or fewer [5]	-34.2%	-13.2%	0.0%

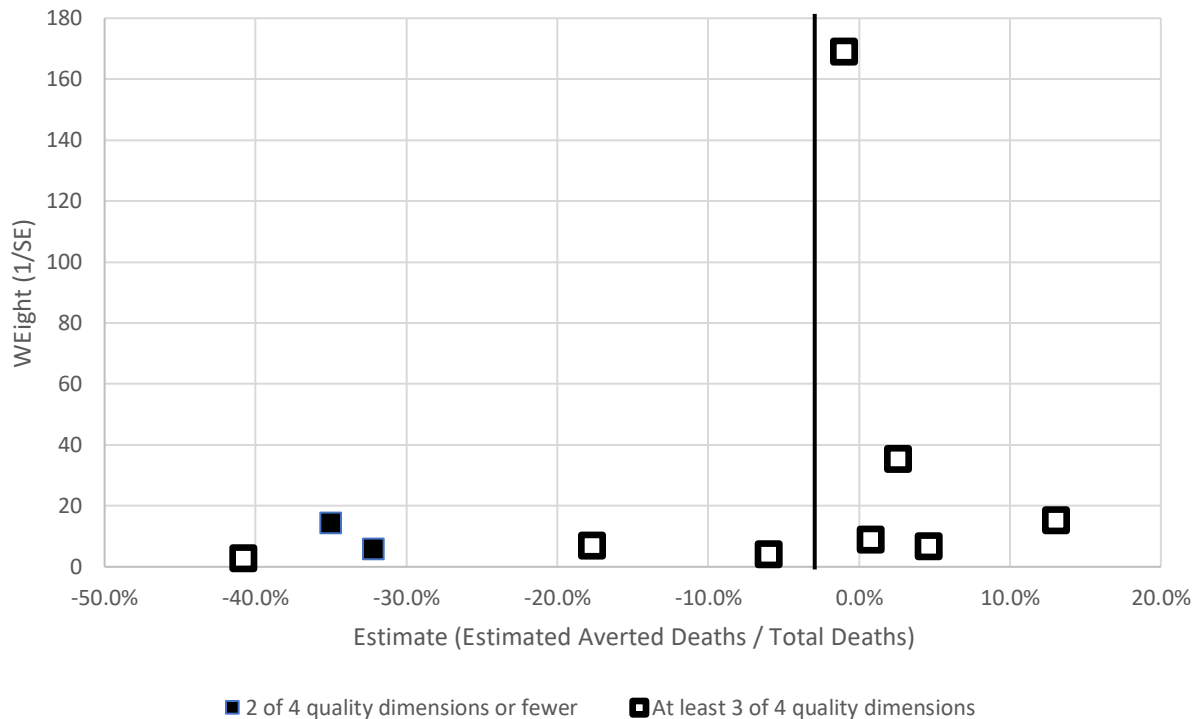

*Note: The table shows the common estimate as described in Table 5 for each quality dimension. The number of studies in each category is in square brackets. * The precision-weighted average does not include studies where no common standard error is available, cf. Table 5.*

Figure 6 shows a funnel plot for the studies in Table 5, except Chaudhry et al. (2020) and Berry et al. (2021), where common standard errors cannot be derived. Sears et al. (2020) stands out with a precision far higher than those of the other studies. But generally, the precisions of the studies are low and the estimates are placed on both sides of the zero-line with some ‘tail’ to the

³⁷ Bonardi et al. (2020) only meet one quality dimension (social science).

left.³⁸ Figure 5 also shows that four of eight studies with at least 3 of 4 quality dimensions find that SIPOs *increase* COVID-19 mortality by 0.8% to 13.1%.

Figure 6: Funnel plot for estimates from SIPO studies

Note: The figure displays all estimates and the precision of the estimate defined as one over the standard error. Studies where standard errors are not available are not included. Studies which live up to at least 3 of 4 quality dimensions are marked with white, while studies which lives up to 2 of 4 quality dimensions or less are marked with black. The vertical line illustrates the precision-weighted average.

Overall conclusion on SIPO studies

We find no clear evidence that SIPOs had a noticeable impact on COVID-19 mortality. Some studies find a large negative relationship between lockdowns and COVID-19 mortality, but this seems to be caused by short data series which does not cover a full COVID-19 ‘wave’. Several studies find a small positive relationship between lockdowns and COVID-19 mortality. Although this appears to be counterintuitive, it could be the result of an (asymptomatic) infected person being isolated at home under a SIPO can infect family members with a higher viral load causing more severe illness.³⁹ The overall effect measured by the precision-weighted average is -2.9%. The result is in line with Nuzzo et al. (2019), who state that “In the context of a high-impact

³⁸ This could indicate some publication bias, but the evidence is weak and with only 13 estimates, this cannot be formally tested

³⁹ E.g. see Guallar et al. (2020), who concludes, “Our data support that a greater viral inoculum at the time of SARS-CoV-2 exposure might determine a higher risk of severe COVID-19.”

respiratory pathogen, quarantine may be the least likely NPI to be effective in controlling the spread due to high transmissibility” and World Health Organization Writing Group (2006), who conclude that “forced isolation and quarantine are ineffective and impractical.”⁴⁰

In the following section, we will look at the effect found in studies analyzing specific NPIs.

4.3 Studies of specific NPIs

A total of 11 eligible studies look at (multiple) specific NPIs independently or simply lockdown vs. no lockdown.⁴¹ The definition of the specific NPIs varies from study to study and are somewhat difficult to compare. The variety in the definitions can be seen in the analysis of non-essential business closures and bar/restaurant closures. Chernozhukov et al. (2021) focus on a combined parameter (the average of business closure and bar/restaurant closure in each state), Aparicio and Grossbard (2021) look at business closure but not bar/restaurant closure, Spiegel and Tookes (2021) examine bar/restaurant closure but not business closure, and Guo et al. (2021) look at both business closures and bar/restaurant closures independently.

Some studies include several NPIs (e.g. Stokes et al. (2020) and Spiegel and Tookes (2021)), while others cover very few. Bongaerts et al. (2021) only study business closures, and Leffler et al. (2020) look at internal lockdown and international travel restrictions). Few NPIs in a model are potentially a problem because they can capture the effect of excluded NPIs. On the other hand, several NPIs in a model increase the risk of multiple test bias.

The differences in the choice of NPIs and in the number of NPIs make it challenging to create an overview of the results. In Table 7, we have merged the results in six overall categories but note that the estimates may not be fully comparable across studies. In particular, the lockdown-measure varies from study to study and in some cases is poorly defined by the authors. Also, there are only a few estimates within some of the categories. For instance, the estimate of the effect of facemasks is based on only two studies.

Table 7 illustrates that generally there is no evidence of a noticeable relationship between the most-used NPIs and COVID-19. Overall, lockdowns and limiting gatherings seem to increase COVID-19 mortality, although the effect is modest (0.6% and 1.6%, respectively) and border closures has little to no effect on COVID-19 mortality, with a precision-weighted average of -0.1% (removing the imprecise outlier from Guo et al. (2021) changes the precision-weighted average to -0.2%). We find a small effect of school closure (-4.4%), but this estimate is mainly driven by Auger et al. (2020), who – as noted earlier – use an “interrupted time series study”

⁴⁰ Both Nuzzo et al. (2019) and World Health Organization Writing Group (2006) focus on quarantining infected persons. However, if quarantining infected persons is not effective, it should be no surprise that quarantining uninfected persons could be ineffective too.

⁴¹ Note that we – according to our search strategy – did not search on specific measures such as “school closures” but on words describing the overall political approach to the COVID-19 pandemic such as “non-pharmaceutical,” “NPIs,” “lockdown” etc.

approach and may capture other effects such as seasonal and behavioral effects. The absence of a notable effect of school closures is in line with Irfan et al. (2021), who – based on a systematic review and meta-analysis of 90 published or preprint studies of transmission in children – concluded that “risks of infection among children in educational-settings was lower than in communities. Evidence from school-based studies demonstrate it is largely safe for young children (<10 years of age) to be at schools; however, older children (between 10 and 19 years of age) might facilitate transmission.” UNICEF (2021) and ECDC (2020) reach similar conclusions.⁴²

Mandating facemasks – an intervention that was not widely used in the spring of 2020, and in many countries was even discouraged – seems to have a large effect (-21.2%), but this conclusion is based on only two studies.⁴³ Again, our categorization may play a role, as the larger mask-estimate from Chernozhukov et al. (2021) is in fact “employee facemasks,” not a general mask mandate. Our findings are somewhat in contrast to the result found in a review by Liu et al. (2021), who conclude that “fourteen of sixteen identified randomized controlled trials comparing face masks to no mask controls failed to find statistically significant benefit in the intent-to-treat populations.” Similarly, a pre-COVID Cochrane review concludes, “There is low certainty evidence from nine trials (3507 participants) that wearing a mask may make little or no difference to the outcome of influenza-like illness (ILI) compared to not wearing a mask (risk ratio (RR) 0.99, 95% confidence interval (CI) 0.82 to 1.18). There is moderate certainty evidence that wearing a mask probably makes little or no difference to the outcome of laboratory-confirmed influenza compared to not wearing a mask (RR 0.91, 95% CI 0.66 to 1.26; 6 trials; 3005 participants)” (Jefferson et al. (2020)).⁴⁴ However, it should be noted that even if no effect is found in controlled settings, this does not necessarily imply that mandated face masks does not reduce mortality, as other factors may play a role (e.g. wearing a mask may function as a tax on socializing if people are bothered by wearing a face masks when they are socializing).

⁴² UNICEF (2021) concludes, “The preliminary findings thus far suggest that in-person schooling – especially when coupled with preventive and control measures – had lower secondary COVID-19 transmission rates compared to other settings and do not seem to have significantly contributed to the overall community transmission risks.” Whereas, ECDC (2020) conclude, “School closures can contribute to a reduction in SARS-CoV-2 transmission, but by themselves are insufficient to prevent community transmission of COVID-19 in the absence of other nonpharmaceutical interventions (NPIs) such as restrictions on mass gathering,” and states, “There is a general consensus that the decision to close schools to control the COVID-19 pandemic should be used as a last resort. The negative physical, mental health and educational impact of proactive school closures on children, as well as the economic impact on society more broadly, would likely outweigh the benefits.”

⁴³ Note again, that we – according to our search strategy – did not search on the specific measures such as “masks,” “face masks,” “surgical masks” but on words describing the overall political approach to the COVID-19 pandemic such as “non-pharmaceutical,” “NPIs,” “lockdown” etc. Thus, we do not include most of the studies in mask reviews such as Liu et al. (2021) and Jefferson et al. (2020).

⁴⁴ Lipp and Edwards (2014) also find no evidence of an effect and – looking at disposable surgical face masks for preventing surgical wound infection in clean surgery – conclude, “Three trials were included, involving a total of 2113 participants. There was no statistically significant difference in infection rates between the masked and unmasked group in any of the trials.” Meanwhile, Li et al. (2021) – based on six case-control studies – conclude, “In general, wearing a mask was associated with a significantly reduced risk of COVID-19 infection (OR = 0.38, 95% CI: 0.21-0.69, $I^2 = 54.1\%$).

Only business closure consistently shows evidence of a negative relationship with COVID-19 mortality, but the variation in the estimated effect is large. Three studies find little to no effect, and three find large effects. Two of the larger effects are related to closing bars and restaurants. The “close business” category in Chernozhukov et al. (2021) is an average of closed businesses, restaurants, and movie theaters, while that same category is “closing restaurants and bars” in Spiegel and Tookes (2021). The last study finding a large effect is Bongaerts et al. (2021), the only eligible single-country study.⁴⁵

As a final observation on Table 7, studies with fewer quality dimensions seem to find larger effects, but the pattern is not systematic.⁴⁶

Table 7: Overview of estimates from studies of specific NPIs

	Lockdown (complete/ partial)	Facemasks/ Employee face masks	Business closure (/bars & restaurants)	Border closure (/quarantine)	School closures	Limiting gatherings	Quality dimensions
Chernozhukov et al. (2021)		-34.0%	-28.6%				4
Bongaerts et al. (2021)			-31.6%				2
Chaudhry et al. (2020)*	0.0%			0.0%			2
Toya & Skidmore (2021)	0.5%			-0.1%			3
Aparicio & Grossbard (2021)			-1.3%		0.5%	0.8%	4
Auger et al. (2020)					-58.0%		2
Leffler et al. (2020)	1.7%			-15.6%			2
Stokes et al. (2020)			0.3%	-24.6%	-0.1%	-6.3%	3
Spiegel & Tookes (2021)		-13.5%	-50.2%			11.8%	3
Bonardi et al. (2020)*	0.0%			0.0%			1
Guo et al. (2021)			-0.4%	36.3%	-0.2%	5.7%	3
Precision-weighted average	0.6%	-21.2%	-10.6%	-0.1%	-4.4%	1.6%	
Arithmetic average	0.6%	-23.8%	-18.6%	-0.7%	-14.4%	3.0%	
Median	0.3%	-23.8%	-14.9%	0.0%	-0.1%	3.2%	
4 of 4 quality dimensions	n/a [0]	-34.0% [1]	-2.9% [2]	n/a [0]	0.5% [1]	0.8% [1]	
3 of 4 quality dimensions	0.5% [1]	-13.5% [1]	-21.5% [3]	0.0% [3]	-0.1% [2]	5.6% [3]	
2 of 4 quality dimensions or fewer	1.7% [2]	n/a [1]	-31.6% [2]	-15.6% [2]	-58.0% [1]	n/a [1]	

*Note: * It is not possible to derive common estimates and standard errors from Chaudhry et al. (2020) and Bonardi et al. (2020). Chaudhry et al. (2020) states that the effect of the various NPIs is insignificant without listing the estimates and standard errors. Bonardi et al. (2020) states that partial or regional lockdowns are as effective as stricter NPIs but does not provide information to calculate common estimates. Instead, we assume the estimate is 0% when calculating arithmetic average and median, while the estimates are excluded from the calculation of precision-weighted averages because there are no standard errors.*

⁴⁵ Bongaerts et al. (2021) (implicitly) assume that municipalities with different exposures to closed sectors are not inherently different, which may be a relatively strong assumption and could potentially drive their results.

⁴⁶ We saw with SIPOs that studies based on short data series tended to find larger effects than studies based on short data series. This is also somewhat true for studies examining multiple specific measures. If we focus on studies with long data series (>May 31st, 2020), the precision-weighted estimates are as follows (average for all studies in parentheses for easy comparison): Lockdown (complete/partial): 0.5% (0.6%), Facemasks/Employee face masks: -21.2% (-21.2%), Business closures (/bars & restaurants): -8.1% (-10.6%), Border closures (/quarantine): -0.1% (-0.1%), School closures: 0.5% (-4.4%), Limiting gatherings: 1.4% (1.6%).

Figure 7 shows a funnel plot for all estimates in Table 7, except Chaudhry et al. (2020) and Bonardi et al. (2020), where common standard errors cannot be derived. Two estimates from Toya and Skidmore (2020) stands out with a precision far higher than those of other studies, and estimates are placed with some ‘tail’ to the left, which could indicate some publication bias, i.e. reluctance to publish results that show large positive (more deaths) effects of lockdowns. The most precise estimates are gathered around 0%, while less precise studies are spread out between -58% and 36%. The precision-weighted average of all estimates across all NPIs is -0.6%.

Figure 7: Funnel plot for estimates from studies of specific NPIs

Note: The figure displays all estimates except two (see text in figure) of specific NPIs and the precision of the estimate defined as one over the standard error. Studies where standard errors are not available are not included.

Overall conclusion on specific NPIs

Because of the heterogeneity in NPIs across studies, it is difficult to draw strong conclusions based on the studies of multiple specific measures. We find no evidence that lockdowns, school closures, border closures, and limiting gatherings have had a noticeable effect on COVID-19 mortality. There is some evidence that business closures reduce COVID-19 mortality, but the variation in estimates is large and the effect seems related to closing bars. There may be an effect of mask mandates, but just two studies look at this, one of which one only looks at the effect of employee mask mandates.

5 Concluding observations

Public health experts and politicians have – based on forecasts in epidemiological studies such as that of Imperial College London (Ferguson et al. (2020) – embraced compulsory lockdowns as an effective method for arresting the pandemic. But, have these lockdown policies been effective in curbing COVID-19 mortality? This is the main question answered by our meta-analysis.

Adopting a systematic search and title-based screening, we identified 1,048 studies published by July 1st, 2020, which potentially look at the effect of lockdowns on mortality rates. To answer our question, we focused on studies that examine the actual impact of lockdowns on COVID-19 mortality rates based on registered cross-sectional mortality data and a counterfactual difference-in-difference approach. Out of the 1,048 studies, 34 met our eligibility criteria.

Conclusions

Overall, our meta-analysis fails to confirm that lockdowns have had a large, significant effect on mortality rates. Studies examining the relationship between lockdown strictness (based on the OxCGRT stringency index) find that the average lockdown in Europe and the United States only reduced COVID-19 mortality by 0.2% compared to a COVID-19 policy based solely on recommendations. Shelter-in-place orders (SIPOs) were also ineffective. They only reduced COVID-19 mortality by 2.9%.

Studies looking at specific NPIs (lockdown vs. no lockdown, facemasks, closing non-essential businesses, border closures, school closures, and limiting gatherings) also find no broad-based evidence of noticeable effects on COVID-19 mortality. However, closing non-essential businesses seems to have had some effect (reducing COVID-19 mortality by 10.6%), which is likely to be related to the closure of bars. Also, masks may reduce COVID-19 mortality, but there is only one study that examines universal mask mandates. The effect of border closures, school closures and limiting gatherings on COVID-19 mortality yields precision-weighted estimates of -0.1%, -4.4%, and 1.6%, respectively. Lockdowns (compared to no lockdowns) also do not reduce COVID-19 mortality.

Discussion

Overall, we conclude that lockdowns are not an effective way of reducing mortality rates during a pandemic, at least not during the first wave of the COVID-19 pandemic. Our results are in line with the World Health Organization Writing Group (2006), who state, “Reports from the 1918 influenza pandemic indicate that social-distancing measures did not stop or appear to dramatically reduce transmission [...] In Edmonton, Canada, isolation and quarantine were instituted; public meetings were banned; schools, churches, colleges, theaters, and other public gathering places were closed; and business hours were restricted without obvious impact on the epidemic.” Our findings are also in line with Allen's (2021) conclusion: “The most recent research has shown that lockdowns have had, at best, a marginal effect on the number of Covid-19 deaths.” Poeschl and Larsen (2021) conclude that “interventions are generally effective in

mitigating COVID-19 spread”. But, 9 of the 43 (21%) results they review find “no or uncertain association” between lockdowns and the spread of COVID-19, suggesting that evidence from that own study contradicts their conclusion.

The findings contained in Johanna et al. (2020) are in contrast to our own. They conclude that “for lockdown, ten studies consistently showed that it successfully reduced the incidence, onward transmission, and mortality rate of COVID-19.” The driver of the difference is three-fold. First, Johanna et al. include modelling studies (10 out of a total of 14 studies), which we have explicitly excluded. Second, they included interrupted time series studies (3 of 14 studies), which we also exclude. Third, the only study using a difference-in-difference approach (as we have done) is based on data collected before May 1st, 2020. We should mention that our results indicate that early studies find relatively larger effects compared to later studies.

Our main conclusion invites a discussion of some issues. Our review does not point out *why* lockdowns did not have the effect promised by the epidemiological models of Imperial College London (Ferguson et al. (2020)). We propose four factors that might explain the difference between our conclusion and the view embraced by some epidemiologists.

First, people respond to dangers outside their door. When a pandemic rages, people believe in social distancing regardless of what the government mandates. So, we believe that Allen (2021) is right, when he concludes, “The ineffectiveness [of lockdowns] stemmed from individual changes in behavior: either non-compliance or behavior that mimicked lockdowns.” In economic terms, you can say that the demand for costly disease prevention efforts like social distancing and increased focus on hygiene is high when infection rates are high. Contrary, when infection rates are low, the demand is low and it may even be morally and economically rational not to comply with mandates like SIPOs, which are difficult to enforce. Herby (2021) reviews studies which distinguish between mandatory and voluntary behavioral changes. He finds that – on average – voluntary behavioral changes are 10 times as important as mandatory behavioral changes in combating COVID-19. If people voluntarily adjust their behavior to the risk of the pandemic, closing down non-essential businesses may simply reallocate consumer visits away from “nonessential” to “essential” businesses, as shown by Goolsbee and Syverson (2021), with limited impact on the total number of contacts.⁴⁷ This may also explain why epidemiological model simulations such as Ferguson et al. (2020) – which do not model behavior endogenously – fail to forecast the effect of lockdowns.

Second, mandates only regulate a fraction of our potential contagious contacts and can hardly regulate nor enforce handwashing, coughing etiquette, distancing in supermarkets, etc. Countries like Denmark, Finland, and Norway that realized success in keeping COVID-19 mortality rates relatively low allowed people to go to work, use public transport, and meet privately at home during the first lockdown. In these countries, there were ample opportunities to legally meet with others.

⁴⁷ In economic terms, lockdowns are substitutes for – not complements to – voluntary behavioral changes.

Third, even if lockdowns are successful in initially reducing the spread of COVID-19, the behavioral response may counteract the effect completely, as people respond to the lower risk by changing behavior. As Atkeson (2021) points out, the economic intuition is straightforward. If closing bars and restaurants causes the prevalence of the disease to fall toward zero, the demand for costly disease prevention efforts like social distancing and increased focus on hygiene also falls towards zero, and the disease will return.⁴⁸

Fourth, unintended consequences may play a larger role than recognized. We already pointed to the possible unintended consequence of SIPOs, which may isolate an infected person at home with his/her family where he/she risks infecting family members with a higher viral load, causing more severe illness. But often, lockdowns have limited peoples' access to safe (outdoor) places such as beaches, parks, and zoos, or included outdoor mask mandates or strict outdoor gathering restrictions, pushing people to meet at less safe (indoor) places. Indeed, we do find some evidence that limiting gatherings was counterproductive and increased COVID-19 mortality.

One objection to our conclusions may be that we do not look at the role of timing. If timing is very important, differences in timing may empirically overrule any differences in lockdowns. We note that this objection is not necessarily in contrast to our results. If timing is very important relative to strictness, this suggests that well-timed, but very mild, lockdowns should work as well as, or better than, less well-timed but strict lockdowns. This is not in contrast to our conclusion, as the studies we reviewed analyze the effect of lockdowns compared but to doing very little (see Section 3.1 for further discussion). However, there is little solid evidence supporting the timing thesis, because it is inherently difficult to analyze (see Section 2.2 for further discussion). Also, even if it can be empirically stated that a well-timed lockdown is effective in combating a pandemic, it is doubtful that this information will ever be useful from a policy perspective.

But, what explains the differences between countries, if not differences in lockdown policies? Differences in population age and health, quality of the health sector, and the like are obvious factors. But several studies point at less obvious factors, such as culture, communication, and coincidences. For example, Frey et al. (2020) show that for the same policy stringency, countries with more obedient and collectivist cultural traits experienced larger declines in geographic mobility relative to their more individualistic counterpart. Data from Germany Laliotis and Minos (2020) shows that the spread of COVID-19 and the resulting deaths in predominantly Catholic regions with stronger social and family ties were much higher compared to non-Catholic ones at the local NUTS 3 level.⁴⁹

Government communication may also have played a large role. Compared to its Scandinavian neighbors, the communication from Swedish health authorities was far more subdued and embraced the idea of public health vs. economic trade-offs. This may explain why Helsingen et

⁴⁸ This kind of behavior response may also explain why Subramanian and Kumar (2021) find that increases in COVID-19 cases are unrelated to levels of vaccination across 68 countries and 2947 counties in the United States. When people are vaccinated and protected against severe disease, they have less reason to be careful.

⁴⁹ The NUTS classification (Nomenclature of territorial units for statistics) is a hierarchical system for dividing up the economic territory of the EU and the UK. There are 1215 regions at the NUTS 3-level.

al. (2020), found, based on questionnaire data collected from mid-March to mid-April, 2020, that even though the daily COVID-19 mortality rate was more than four times higher in Sweden than in Norway, Swedes were less likely than Norwegians to not meet with friends (55% vs. 87%), avoid public transportation (72% vs. 82%), and stay home during spare time (71% vs. 87%). That is, despite a more severe pandemic, Swedes were less affected in their daily activities (legal in both countries) than Norwegians.

Many other factors may be relevant, and we should not underestimate the importance of coincidences. An interesting example illustrating this point is found in Arnarson (2021) and Björk et al. (2021), who show that areas where the winter holiday was relatively late (in week 9 or 10 rather than week 6, 7 or 8) were hit especially hard by COVID-19 during the first wave because the virus outbreak in the Alps could spread to those areas with ski tourists. Arnarson (2021) shows that the effect persists in later waves. Had the winter holiday in Sweden been in week 7 or week 8 as in Denmark, the Swedish COVID-19 situation could have turned out very differently.⁵⁰

Policy implications

In the early stages of a pandemic, before the arrival of vaccines and new treatments, a society can respond in two ways: mandated behavioral changes or voluntary behavioral changes. Our study fails to demonstrate significant positive effects of mandated behavioral changes (lockdowns). This should draw our focus to the role of voluntary behavioral changes. Here, more research is needed to determine how voluntary behavioral changes can be supported. But it should be clear that one important role for government authorities is to provide information so that citizens can voluntarily respond to the pandemic in a way that mitigates their exposure.

Finally, allow us to broaden our perspective after presenting our meta-analysis that focuses on the following question: “What does the evidence tell us about the effects of lockdowns on mortality?” We provide a firm answer to this question: The evidence fails to confirm that lockdowns have a significant effect in reducing COVID-19 mortality. The effect is little to none.

The use of lockdowns is a unique feature of the COVID-19 pandemic. Lockdowns have not been used to such a large extent during any of the pandemics of the past century. However, lockdowns during the initial phase of the COVID-19 pandemic have had devastating effects. They have contributed to reducing economic activity, raising unemployment, reducing schooling, causing political unrest, contributing to domestic violence, and undermining liberal democracy. These costs to society must be compared to the benefits of lockdowns, which our meta-analysis has shown are marginal at best. Such a standard benefit-cost calculation leads to a strong conclusion: lockdowns should be rejected out of hand as a pandemic policy instrument.

⁵⁰ Another case of coincidence is illustrated by Shenoy et al. (2022), who find that areas that experienced rainfall early in the pandemic realized fewer deaths because the rainfall induced social distancing.

6 Appendix A. The role of timing

Some of the included papers study the importance of the timing of lockdowns, while several other papers only looking at timing of (but not on the inherent effect of) lockdowns have been excluded from the literature list in this review. There's no doubt that being prepared for a pandemic and knowing when it arrives at your doorstep is vital. However, two problems arise with respect to imposing early lockdowns.

First of all, it was virtually impossible to determine the right timing when COVID-19 hit Europe and the United States. The World Health Organization declared the outbreak of a pandemic on 11 March 2020, but at that date Italy had already registered 13.7 COVID-19-deaths per million (all infected before approximately 22 February, because of the roughly 18 day gap between infection and death, c.f. e.g.. Bjørnskov (2021a)). On 29 March 2020, 18 days after WHO declared the outbreak a pandemic and the earliest a lockdown response to WHO's announcement could have an effect, the death toll in Italy was a staggering 178 COVID-19-deaths per million with an additionally 13 per million dying each day.

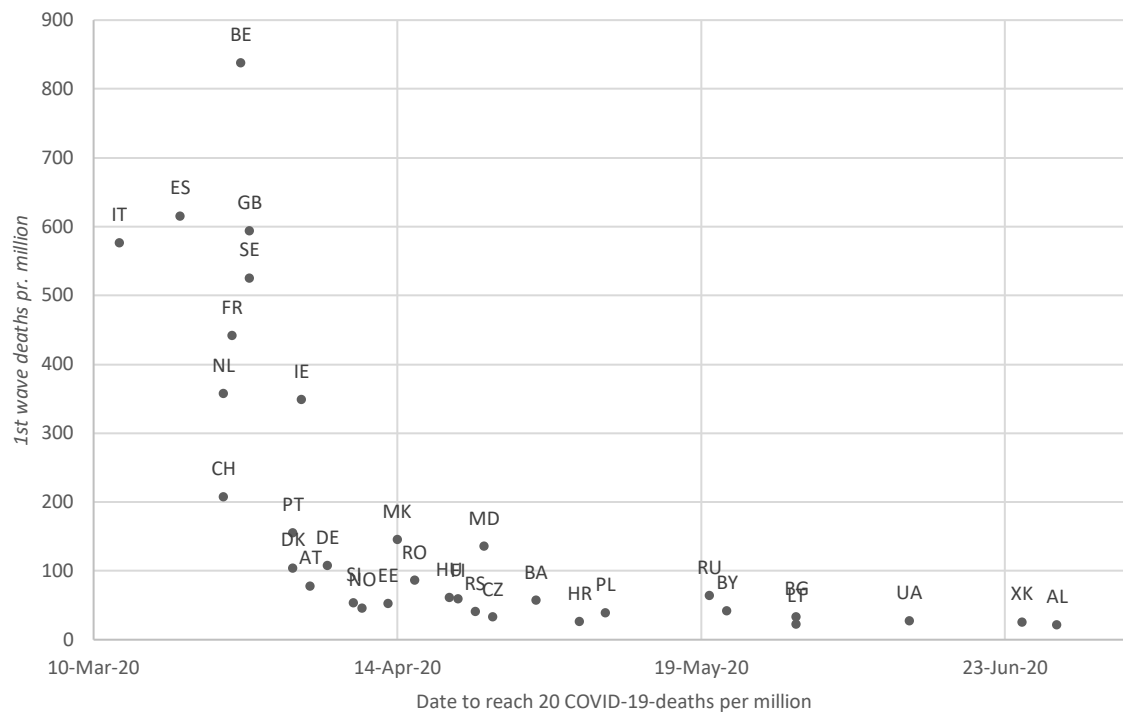

There are reasons to believe that many countries and regions were hit particularly hard during the first wave of COVID, because they had no clue about how bad it really was. This point is illustrated in Figure 8 (and Figure 9), which show that countries (and states), which were hit hard and early, experienced large death tolls compared to countries where the pandemic had a slower start. Björk et al. (2021) and Arnarson (2021) show that areas with a winter holiday in week 10 and – especially – week 9 were hit hard, because they imported cases from the Alps *before* they knew the pandemic was wide spread at the ski resorts. Hence, while acting early by warning citizens and closing business may be an effective strategy; this was not a feasible strategy for most countries in the spring of 2020.

The second problem is that it is extremely difficult to differentiate between the effect of public awareness and the effect of lockdowns. If people and politicians react to the same information, for example deaths in geographical neighboring countries (many EU-countries reacted to deaths in Italy) or in another part of the same country, the effect of lockdowns cannot easily be separated from the effect of voluntary social distancing or, use of hand sanitizers. Hence, we find it problematic to use national lockdowns and differences in the progress of the pandemic in different regions to say anything about the effect of early lockdowns on the pandemic, as the estimated effect might just as well come from voluntary behavior changes, when people in Southern Italy react to the situation in Northern Italy.

We have seen no studies which we believe credibly separate the effect of early lockdown from the effect of early voluntary behavior changes. Instead, the estimates in these studies capture the effects of lockdowns *and* voluntary behavior changes. As Herby (2021) illustrates, voluntary behavior changes are essential to a society's response to an pandemic and can account for up to 90% of societies' total response to the pandemic.

Including these studies will greatly overestimate the effect of lockdowns, and, hence, we chose not to include studies focusing on timing of lockdowns in our review.

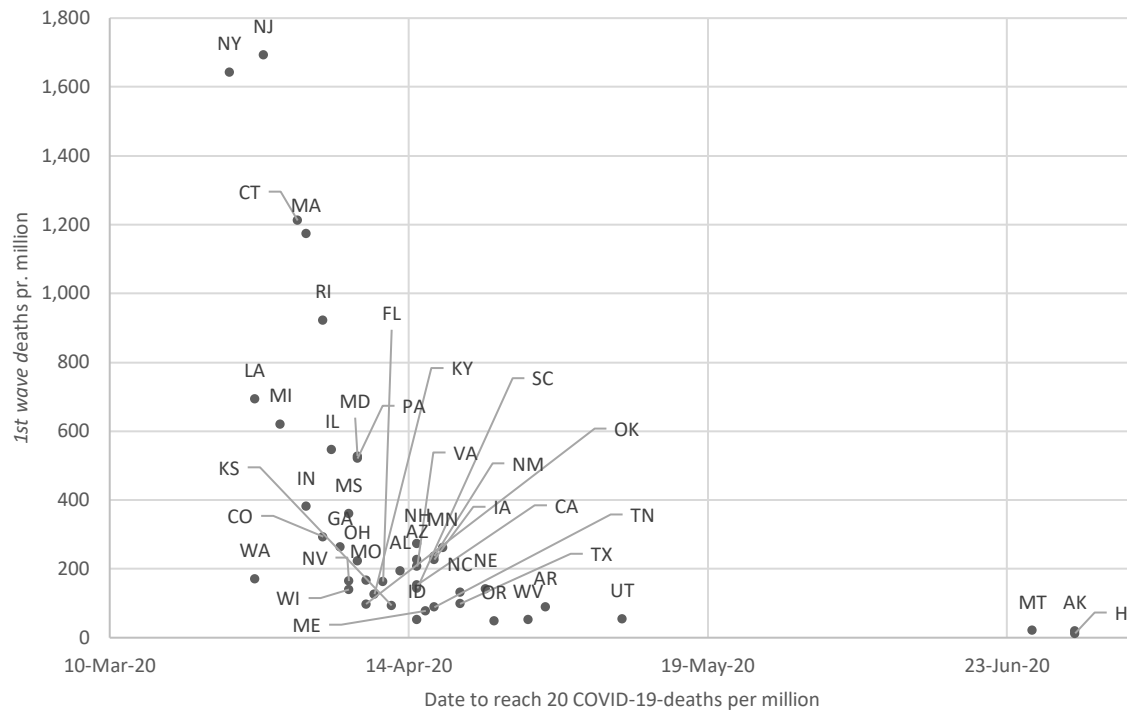

Figure 8: Taken by surprise. The importance of having time to prepare in Europe

Description: European countries with more than one million citizens.

Source: Our World in Data

Figure 9: Taken by surprise. The importance of having time to prepare in U.S. states

Description: U.S. states with more than one million citizens.

Source: Our World in Data

7 Appendix B. Supplementary information

7.1 Excluded studies

Below is a list will the studies excluded during the eligibility phase of our identification process and a short description of our basis for excluding the study.

Table 8: Studies excluded during the eligibility phase of our identification process

1. Study (Author & title)	2. Reason for exclusion
Alemán et al. (2020); "Evaluating the effectiveness of policies against a pandemic"	Too few observations
Alshammari et al. (2021); "Are countries' precautionary actions against COVID-19 effective? An assessment study of 175 countries worldwide"	Is purely descriptive
Amuedo-Dorantes et al. (2020); "Timing is Everything when Fighting a Pandemic: COVID-19 Mortality in Spain"	Duplicate
Amuedo-Dorantes et al. (2021); "Early adoption of non-pharmaceutical interventions and COVID-19 mortality"	Only looks at timing
Amuedo-Dorantes, Kaushal and Muchow (2020); "Is the Cure Worse than the Disease? County-Level Evidence from the COVID-19 Pandemic in the United States"	Duplicate
Amuedo-Dorantes, Kaushal and Muchow (2021); "Timing of social distancing policies and COVID-19 mortality: county-level evidence from the U.S."	Only looks at timing
Arruda et al. (2021); "ASSESSING THE IMPACT OF SOCIAL DISTANCING ON COVID-19 CASES AND DEATHS IN BRAZIL: AN INSTRUMENTED DIFFERENCE-IN-DIFFERENCE APPROACH"	Social distancing (not
Bakolis et al. (2021); "Changes in daily mental health service use and mortality at the commencement and lifting of COVID-19 'lockdown' policy in 10 UK sites: a regression analysis"	Uses a time series approach
Bardey, Fernández and Gravel (2021); "Coronavirus and social distancing: do non-pharmaceutical-interventions work (at least) in the short run?"	Only looks at timing
Berardi et. Al. (2020); "The COVID-19 pandemic in Italy: policy and technology impact on health and non-health outcomes"	Too few observations
Bhalla (2020); "Lockdowns and Closures vs COVID-19: COVID Wins"	Uses modelling
Björk et al. (2021); "Impact of winter holiday and government responses on mortality in Europe during the first wave of the COVID-19 pandemic"	Only looks at timing
Bongaerts, Mazzola and Wagner (2020); "Closed for business"	Duplicate
Born, Dietrich and Müller (2021); "The lockdown effect: A counterfactual for Sweden"	Synthetic control study
Born, Dietrich and Müller (2021); "The lockdown effect: A counterfactual for Sweden"	Duplicate
Bushman et al. (2020); "Effectiveness and compliance to social distancing during COVID-19"	Social distancing (not
Castaneda and Saygili (2020); "The effect of shelter-in-place orders on social distancing and the spread of the COVID-19 pandemic: a study of Texas"	Uses a time series approach
Cerqueti et al. (2021); "The sooner the better: lives saved by the lockdown during the COVID-19 outbreak. The case of Italy"	Synthetic control study
Chernozhukov, Kasahara and Schrimpf (2021); "Mask mandates and other lockdown policies reduced the spread of COVID-19 in the U.S."	Duplicate
Chin et al. (2020); "Effects of non-pharmaceutical interventions on COVID-19: A Tale of Three Models"	Uses modelling
Cho (2020); "Quantifying the impact of nonpharmaceutical interventions during the COVID-19 outbreak: The case of Sweden"	Synthetic control study
Coccia (2020); "The effect of lockdown on public health and economic system: findings from first wave of the COVID-19 pandemic for designing effective strategies to cope with the pandemic"	Only looks at timing
Coccia (2021); "Different effects of lockdown on public health and economy of countries: Results from first wave of the COVID-19 pandemic"	Too few observations
Canyon and Thomsen (2021); "COVID-19 in Scandinavia"	Synthetic control study
Canyon et al. (2020); "Lockdowns and COVID-19 deaths in Scandinavia"	Too few observations
Dave et al. (2020); "Did the Wisconsin Supreme Court restart a COVID-19 epidemic? Evidence from a natural experiment"	Synthetic control study
Delis, Iosifidi and Tasiou (2021); "Efficiency of government policy during the COVID-19 pandemic"	Do not look at mortality
Dreher et al. (2021); "Policy interventions, social distancing, and SARS-CoV-2 transmission in the United States: a retrospective state-level analysis"	Do not look at mortality
Duchemin, Veber and Boussau (2020); "Bayesian investigation of SARS-CoV-2-related mortality in France"	Uses modelling
Fair et. Al. (2021); "Estimating COVID-19 cases and deaths prevented by non-pharmaceutical interventions in 2020-2021, and the impact of individual actions: a retrospective analysis"	Uses modelling
Filiás (2020); "The impact of government policies effectiveness on the officially reported deaths attributed to covid-19."	Student paper
Fowler et al. (2021); "Stay-at-home orders associate with subsequent decreases in COVID-19 cases and fatalities in the United States"	Duplicate
Friedson et al. (2020); "Did California's shelter-in-place order work? Early coronavirus-related public health effects"	Duplicate
Friedson et al. (2020); "Shelter-in-place orders and public health: evidence from California during the COVID-19 pandemic"	Synthetic control study
Fuss, Weizman and Tan (2020); "COVID19 pandemic: how effective are interventive control measures and is a complete lockdown justified? A comparison of countries and lockdown strategies"	Do not look at mortality
Ghosh, Ghosh and Narymanchi (2020); "A Study on The Effectiveness of Lock-down Measures to Control The Spread of COVID-19"	Synthetic control study
Glogowsky et al. (2021); "How Effective Are Social Distancing Policies? Evidence on the Fight Against COVID-19"	Only looks at timing
Glogowsky, Hansen and Schächtele (2020); "How effective are social distancing policies? Evidence on the fight against COVID-19 from Germany"	Duplicate
Glogowsky, Hansen and Schächtele (2020); "How Effective Are Social Distancing Policies? Evidence on the Fight Against COVID-19 from Germany"	Duplicate
Gordon, Grafton and Steinshamn (2021); "Cross-country effects and policy responses to COVID-19 in 2020: The Nordic countries"	Do not look at mortality
Gordon, Grafton and Steinshamn (2021); "Statistical Analyses of the Public Health and Economic Performance of Nordic Countries in Response to the COVID-19 Pandemic"	Too few observations
Guo et al. (2020); "Social distancing interventions in the United States: An exploratory investigation of determinants and impacts"	Duplicate
Huber and Langen (2020); "The impact of response measures on COVID-19-related hospitalization and death rates in Germany and Switzerland"	Duplicate
Huber and Langen (2020); "Timing matters: the impact of response measures on COVID-19-related hospitalization and death rates in Germany and Switzerland"	Only looks at timing
Jain et al. (2020); "A comparative analysis of COVID-19 mortality rate across the globe: An extensive analysis of the associated factors"	Do not look at mortality
Juranek and Zoutman (2021); "The effect of non-pharmaceutical interventions on the demand for health care and mortality: evidence on COVID-19 in Scandinavia"	Too few observations
Kakpo and Nuhu (2020); "Effects of Social Distancing on COVID-19 Infections and Mortality in the U.S."	Social distancing (not
Kapoor and Ravi (2020); "Impact of national lockdown on COVID-19 deaths in select European countries and the U.S. using a Changes-in-Changes model"	Too few observations
Khatiwada and Chalise (2020); "Evaluating the efficiency of the Swedish government policies to control the spread of Covid-19."	Student paper
Korevaar et al. (2020); "Quantifying the impact of U.S. state non-pharmaceutical interventions on COVID-19 transmission"	Do not look at mortality
Kumar et. Al. (2020); "Prevention-Versus Promotion-Focus Regulatory Efforts on the Disease Incidence and Mortality of COVID-19: A Multinational Diffusion Study Using Synthetic Control"	Do not look at mortality
Le et al. (2020); "Impact of government-imposed social distancing measures on COVID-19 morbidity and mortality around the world"	Uses a time series approach
Liang et al. (2020); "Covid-19 mortality is negatively associated with test number and government effectiveness"	Not effect of lockdowns
Mader and Rüttemauer (2021); "The effects of non-pharmaceutical interventions on COVID-19-related mortality: A generalized synthetic control approach across 169 countries"	Synthetic control study
Matzinger and Skinner (2020); "Strong impact of closing schools, closing bars and wearing masks during the Covid-19 pandemic: results from a simple and revealing analysis"	Uses modelling
Mccafferty and Ashley (2020); "Covid-19 Social Distancing Interventions by State Mandate and their Correlation to Mortality in the United States"	Duplicate
Medline et al. (2020); "Evaluating the impact of stay-at-home orders on the time to reach the peak burden of Covid-19 cases and deaths: does timing matter?"	Only looks at timing

1. Study (Author & title)	2. Reason for exclusion
Mu et al. (2020); "Effect of social distancing interventions on the spread of COVID-19 in the state of Vermont"	Uses modelling
Nakamura (2020); "The Impact of Rapid State Policy Response on Cumulative Deaths Caused by COVID-19"	Student paper
Neidhöfer and Neidhöfer (2020); "The effectiveness of school closures and other pre-lockdown COVID-19 mitigation strategies in Argentina, Italy, and South Korea"	Synthetic control study
Oliveira (2020); "Does Staying at Home Save Lives? An Estimation of the Impacts of Social Isolation in the Registered Cases and Deaths by COVID-19 in Brazil"	Social distancing (not
Palladina et al. (2020); "Effect of Implementation of the Lockdown on the Number of COVID-19 Deaths in Four European Countries"	Uses a time series approach
Palladina et al. (2020); "Effect of timing of implementation of the lockdown on the number of deaths for COVID-19 in four European countries"	Duplicate
Palladino et al. (2020); "Excess deaths and hospital admissions for COVID-19 due to a late implementation of the lockdown in Italy"	Uses a time series approach
Peixoto et al. (2020); "Rapid assessment of the impact of lockdown on the COVID-19 epidemic in Portugal"	Uses modelling
Piovani et al. (2021); "Effect of early application of social distancing interventions on COVID-19 mortality over the first pandemic wave: An analysis of longitudinal data from 37"	Only looks at timing
Reinbold (2021); "Effect of fall 2020 K-12 instruction types on CoViD-19 cases, hospital admissions, and deaths in Illinois counties"	Synthetic control study
Renne, Roussellet and Schwenkler (2020); "Preventing COVID-19 Fatalities: State versus Federal Policies"	Uses modelling
Siedner et al. (2020); "Social distancing to slow the U.S. COVID-19 epidemic: Longitudinal pretest-posttest comparison group study"	Duplicate
Siedner et al. (2020); "Social distancing to slow the U.S. COVID-19 epidemic: Longitudinal pretest-posttest comparison group study"	Uses a time series approach
Silva, Filho and Fernandes (2020); "The effect of lockdown on the COVID-19 epidemic in Brazil: evidence from an interrupted time series design"	Uses a time series approach
Stamam et al. (2020); "IMPACT OF LOCKDOWN MEASURE ON COVID-19 INCIDENCE AND MORTALITY IN THE TOP 31 COUNTRIES OF THE WORLD."	Uses a time series approach
Steinegger et al. (2021); "Retrospective study of the first wave of COVID-19 in Spain: analysis of counterfactual scenarios"	Only looks at timing
Stephens et al. (2020); "Does the timing of government COVID-19 policy interventions matter? Policy analysis of an original database."	Only looks at timing
Supino et al. (2020); "The effects of containment measures in the Italian outbreak of COVID-19"	Uses a time series approach
Timelli and Girardi (2021); "Effect of timing of implementation of containment measures on Covid-19 epidemic. The case of the first wave in Italy"	Only looks at timing
Trivedi and Das (2020); "Effect of the timing of stay-at-home orders on COVID-19 infections in the United States of America"	Only looks at timing
Umer and Khan (2020); "Evaluating the Effectiveness of Regional Lockdown Policies in the Containment of Covid-19: Evidence from Pakistan"	Too few observations
VoPham et al. (2020); "Effect of social distancing on COVID-19 incidence and mortality in the U.S."	Do not look at mortality
Wu and Wu (2020); "Stay-at-home and face mask policies intentions inconsistent with incidence and fatality during U.S. COVID-19 pandemic"	Too few observations
Xu et al. (2020); "Associations of Stay-at-Home Order and Face-Masking Recommendation with Trends in Daily New Cases and Deaths of Laboratory-Confirmed COVID-19 in"	Do not look at mortality
Yehya, Venkataramani and Harhay (2020); "Statewide Interventions and Coronavirus Disease 2019 Mortality in the United States: An Observational Study"	Only looks at timing
Ylli et al. (2020); "The lower COVID-19 related mortality and incidence rates in Eastern European countries are associated with delayed start of community circulation Alban"	Not effect of lockdowns

7.2 Interpretation of estimates and conversion to common estimates

In Table 9, we describe for each study used in the meta-analysis how we interpret their results and convert the estimates to our common estimate. Standard errors are converted such that the t-value, calculated based on common estimates and standard errors, is unchanged. When confidence intervals are reported rather than standard errors, we calculate standard errors using t-distribution with ∞ degrees of freedom (i.e. 1.96 for 95% confidence interval).

Table 9: Notes on studies included in the meta-analysis

1. Study (Author & title)	2. Date Published	3. Journal	4. Comments regarding meta-analysis
Alderman and Harjoto (2020); "COVID-19: U.S. shelter-in-place orders and demographic characteristics linked to cases, mortality, and recovery rates"	26-Nov-20	Transforming Government: People, Process and Policy	We use the 1% effect noted by the authors in "We find that the natural log of the duration (in days) that the state instituted shelter-in-place reduces percentages of mortality by 0.0001%, or approximately 1% of the means of percentages of deaths per capita in our sample. The standard error is calculated on basis of the t-value in Table 3.
Aparicio and Grossbard (2021); "Are Covid Fatalities in the U.S. Higher than in the EU, and If so, Why?"	16-Jan-21	Review of Economics of the Household	We use estimates from Table 3, model 5. For each estimate the common estimate is calculated as (difference in COVID-19 mortality with NPI)/(difference in COVID-19 mortality without NPI)-1, where (difference in COVID-19 mortality with NPI) is 237.89 (Table 2 states that deaths per million is 406.99 in U.S. and 169.10 in Europe) and (difference in COVID-19 mortality without NPI) is estimated as $\exp(\ln(\text{difference in COVID-19 mortality with NPI}) - \text{estimate})$.
Ashraf (2020); "Socioeconomic conditions, government interventions and health outcomes during COVID-19"	1-Jul-20	ResearchGate	It is unclear whether they prefer the model with or without the interaction term. In the meta-analysis, we use an average of -0.326 (Table 3, without) and -0.073 (Table 6, with) deaths per million per stringency point (i.e. -0.200). The common estimate is the average effect in Europe and United States respectively calculated as (Actual COVID-19 mortality) / (COVID-19 mortality with recommendation policy) - 1, where (COVID-19 mortality with recommendation policy) is calculated as ((Actual COVID-19 mortality) - Estimate x Difference in stringency x population). Stringencies in Europe and United States are equal to the average stringency from March 16th to April 15th 2020 (76 and 74 respectively) and the stringency for the policy based solely on recommendations is 44 following Hale et al. (2020).

1. Study (Author & title)	2. Date Published	3. Journal	4. Comments regarding meta-analysis
Auger et al. (2020); "Association between statewide school closure and COVID-19 incidence and mortality in the U.S."	1-Sep-20	JAMA	Estimate that school closure was associated with a 58% decline in COVID-19 mortality and that the effect was largest in states with low cumulative incidence of COVID-19 at the time of school closure. States with the lowest incidence of COVID-19 had a -72% relative change in incidence compared with -49% for those states with the highest cumulative incidence.
Berry et al. (2021); "Evaluating the effects of shelter-in-place policies during the COVID-19 pandemic"	24-Feb-21	PNAS	The estimated effect of SIPO's, an increase in deaths by 0,654 per million after 14 days (significant, cf. Fig. 2), is converted to a relative effect on a state basis based on data from OurWorldInData. For states which did implement SIPO, we calculate the number of deaths without SIPO as the number of official COVID-19 deaths 14 days after SIPO was implemented minus 0,654 extra deaths per million. For states which did not implement SIPO, we calculate the number of deaths with SIPO as the number of official COVID-19 deaths 14 days after March 31 2020 plus 0,654 extra deaths per million. We use March 31 2020 as this was the average date on which SIPO was implemented in the 40 states which did implement SIPO. Using this approximation, the effect of SIPO's in the U.S. is 1,1% more deaths after 14 days. Common standard errors are not available.
Bjørnskov (2021a); "Did Lockdown Work? An Economist's Cross-Country Comparison"	29-Mar-21	CESifo Economic Studies	We use estimates from Table 2 (four weeks). Common estimate is calculated as the average of the effect in Europe and United States, where the effect for each is calculated as $(\ln(\text{policy stringency}) - \ln(\text{recommendation stringency})) \times \text{estimate}$.
Blanco et al. (2020); "Do Coronavirus Containment Measures Work? Worldwide Evidence"	1-Dec-20	World Bank Group	The study is not included in the meta-analysis, as it looks at the effect of NPIs on growth rates and does not include an estimate of the effect on total mortality.
Bonardi et al. (2020); "Fast and local: How did lockdown policies affect the spread and severity of the covid-19"	8-Jun-20	0	Find that, world-wide, internal NPIs have prevented about 650,000 deaths (3.11 deaths were prevented for each death that occurred, i.e. 76% effect). However, this effect is for any lockdown including a Swedish lockdown. They do not find an extra effect of stricter lockdowns and state that "our results point to the fact that people might adjust their behaviors quite significantly as partial measures are implemented, which might be enough to stop the spread of the virus." Hence, whether the baseline is Sweden, which implemented a ban on large gatherings early in the pandemic, or the baseline is "doing nothing" can affect the magnitude of the estimated impacts. Since all Western countries did something and estimates in other reviewed studies are relative to doing less – and, hence not to doing nothing, we report the result from Bonardi et al. as compared to "doing less." Hence, for Bonardi et al. we use 0% as the common estimate in the meta-analysis for each NPI (SIPO, regional lockdown, partial lockdown, and border closure (stage 1, stage 2 and full) because all NPIs are insignificant (compared to Sweden's "doing the least"-lockdown).
Bongaerts et al. (2021); "Closed for business: The mortality impact of business closures during the Covid-19 pandemic"	14-May-21	PLOS ONE	Business shutdown saved 9,439 Italian lives by 13th 2020. This corresponds to 32%, as there were 20,465 COVID-19-deaths in Italy by mid April 2020.
Chaudhry et al. (2020); "A country level analysis measuring the impact of government actions, country preparedness and socioeconomic factors on COVID-19 mortality and related health outcomes"	1-Aug-20	Eclinical-Medicine	Finds no effect of partial border closure, complete border closure, partial lockdown (physical distancing measures only), complete lockdown (enhanced containment measures including suspension of all non-essential services), and curfews. In the meta-analysis we use a common estimate of 0%, as estimates and standard errors are not available.
Chernozhukov et al. (2021); "Causal impact of masks, policies, behavior on early covid-19 pandemic in the U.S."	1-Jan-21	Journal of Econometrics	The study looks at the effect of NPIs on growth rates but does include an estimate of the effect on total mortality at the end of the study period for employee face masks (-34%), business closure (-29%). and SIPO (-18%), but not for school closures (which we therefore exclude). In reporting the results of their counterfactual, they alter between "fewer deaths with NPI" and "more deaths without NPI." We have converted the latter to the former as $\text{estimate}/(1+\text{estimate})$ so "without business closures deaths would be about 40% higher" corresponds to "with business closures deaths would be about 29% lower."
Chisadza et al. (2021); "Government Effectiveness and the COVID-19 Pandemic"	10-Mar-21	MDPI	The common estimate is the average effect in Europe and United States respectively calculated as $(\text{Actual COVID-19 mortality}) / (\text{COVID-19 mortality with recommendation policy}) - 1$, where $(\text{COVID-19 mortality with recommendation policy})$ is calculated as $(\text{Actual COVID-19 mortality}) - \text{Estimate} \times \text{Difference in stringency} \times \text{population}$. Stringencies in Europe and United States are equal to the average stringency from March 16th to April 15th 2020 (76 and 74 respectively) and the stringency for the policy based solely on recommendations is 44 following Hale et al. (2020). In the meta-analysis we use the non-linear estimate, but the squared estimate yields similar results.
Dave et al. (2021); "When Do Shelter-in-Place Orders"	3-Aug-20	Economic Inquiry	The study looks at the effect of SIPO's on growth rates but does include an estimate of the effect on total mortality after 20+ days for model 1 and 2 in Table 7. Since model 3, 4 and 5 have estimates

1. Study (Author & title)	2. Date Published	3. Journal	4. Comments regarding meta-analysis
Fight Covid-19 Best? Policy Heterogeneity Across States and Adoption Time"			similar to model 2, we use an average of model 1 to 5, where the estimates of model 3 to 5 are calculated as (common estimate model 2) / (estimate model 2) x estimate model 3/4/5.
Dergiades et al. (2020); "Effectiveness of government policies in response to the COVID-19 outbreak"	28-Aug-20	SSRN	The study is not included in the meta-analysis, as it looks at the effect of NPIs on growth rates and does not include an estimate of the effect on total mortality.
Fakir and Bharati (2021); "Pandemic catch-22: The role of mobility restrictions and institutional inequalities in halting the spread of COVID-19"	28-Jun-21	PLOS ONE	The study is not included in the meta-analysis, as it looks at the effect of NPIs on growth rates and does not include an estimate of the effect on total mortality.
Fowler et al. (2021); "Stay-at-home orders associate with subsequent decreases in COVID-19 cases and fatalities in the United States"	10-Jun-21	PLOS ONE	The study looks at the effect of SIPO's on growth rates but does include an estimate of the effect on total mortality after three weeks (35% reduction in deaths) which is used in the meta-analysis.
Fuller et al. (2021); "Mitigation Policies and COVID-19-Associated Mortality – 37 European Countries, January 23–June 30, 2020"	15-Jan-21	Morbidity and Mortality Weekly Report	For each 1-unit increase in OxCGRT stringency index, the cumulative mortality decreases by 0.55 deaths per 100,000. The common estimate is the average effect in Europe and United States respectively calculated as (Actual COVID-19 mortality) / (COVID-19 mortality with recommendation policy) -1, where (COVID-19 mortality with recommendation policy) is calculated as ((Actual COVID-19 mortality) - Estimate x Difference in stringency x population). Stringencies in Europe and United States are equal to the average stringency from March 16th to April 15th 2020 (76 and 74 respectively) and the stringency for the policy based solely on recommendations is 44 following Hale et al. (2020).
Gibson (2020); "Government mandated lockdowns do not reduce Covid-19 deaths: implications for evaluating the stringent New Zealand response"	18-Aug-20	New Zealand Economic Papers	We use the two graphs to the left in figure 3, where we extract the data from the rightmost datapoint (i.e. % impact of county lockdowns on Covid-19 deaths by 1/06/2020). We then take the average of the estimates found in the two graphs, because it is unclear which estimate the author prefers.
Goldstein et al. (2021); "Lockdown Fatigue: The Diminishing Effects of Quarantines on the Spread of COVID-19 "	4-Feb-21	CID Faculty Working	We convert the effect in Figure 4 after 90 days (log difference -1.16 of a standard deviation change) to deaths per million per stringency following footnote 3 (the footnote says "weekly deaths," but we believe this should be "daily deaths"), so the effect is $e^{-1.16} - 1 = -0.69$ decline in daily deaths per million per SD. We convert to total effect by multiplying with 90 days and "per point" by dividing with $SD = 22.3$ (corresponding to the SD for the 147 countries with data before March 19, 2020 - using all data yields similar results) yielding -2.77 deaths per million per stringency point. The common estimate is the average effect in Europe and United States respectively calculated as (Actual COVID-19 mortality) / (COVID-19 mortality with recommendation policy) -1, where (COVID-19 mortality with recommendation policy) is calculated as ((Actual COVID-19 mortality) - Estimate x Difference in stringency x population). Stringencies in Europe and United States are equal to the average stringency from March 16th to April 15th 2020 (76 and 74 respectively) and the stringency for the policy based solely on recommendations is 44 following Hale et al. (2020).
Guo et al. (2021); "Mitigation Interventions in the United States: An Exploratory Investigation of Determinants and Impacts"	21-Sep-20	Research on Social Work Practice	We use estimates for "Proportion of Cumulative Deaths Over the Population" (per 10,000) in Table 3. We interpret this number as the change in cumulative deaths over the population in percent and is therefore the same as our common estimate.
Hale et al. (2020); "Global assessment of the relationship between government response measures and COVID-19 deaths"	6-Jul-20	medRxiv	The study is not included in the meta-analysis, as it looks at the effect of NPIs on growth rates and does not include an estimate of the effect on total mortality. They ascertain that "sustained over three months, this would correspond to a cumulative number of deaths 30% lower," however this is not a counterfactual estimate and three months goes beyond the period they have data for.
Hunter et al. (2021); "Impact of non-pharmaceutical interventions against COVID-19 in Europe: A quasi-experimental non-equivalent group and time-series"	15-Jul-21	Eurosurveillance	The study is not included in the meta-analysis, as they report the effect of NPIs in incident risk ratio which are not easily converted to relative effects.

1. Study (Author & title)	2. Date Published	3. Journal	4. Comments regarding meta-analysis
Langeland et al. (2021); "The Effect of State Level COVID-19 Stay-at-Home Orders on Death Rates"	5-Mar-21	Culture & Crisis Conference	The study is not included in the meta-analysis, as it looks at the effect of NPIs on odds-ratios and does not include an estimate of the effect on total mortality.
Leffler et al. (2020); "Association of country-wide coronavirus mortality with demographics, testing, lockdowns, and public wearing of masks"	26-Oct-20	ASTMH	Their "mask recommendation" includes some countries, where masks were mandated and may (partially) capture the effect of mask mandates. However, the authors' focus is on recommendation, so we do interpret their result as a voluntary effect - not an effect of mask mandate. Using estimates from Table 2 and assuming NPIs were implemented March 15 (8 weeks in total by end of study period), common estimates are calculated as $\hat{\theta}^{est-1}$.
Mccafferty and Ashley (2021); "Covid-19 Social Distancing Interventions by Statutory Mandate and Their Observational Correlation to Mortality in the United States and Europe"	27-Apr-21	Pragmatic and Observational Research	The study is not included in the meta-analysis, as it looks at the effect of NPIs on peak mortality and does not include an estimate of the effect on total mortality.
Pan et al. (2020); "Covid-19: Effectiveness of non-pharmaceutical interventions in the united states before phased removal of social distancing protections varies by region"	20-Aug-20	medRxiv	The study is not included in the meta-analysis, as the cluster the NPIs (e.g. SIPO, mask mandata amd travel restricions are clustered in Level 4).
Pincombe et al. (2021); "The effectiveness of national-level containment and closure policies across income levels during the COVID-19 pandemic: an analysis of 113 countries"	4-May-21	Health Policy and Planning	Policy implementations were assigned according to the first day that a country received a policy stringency rating above 0 in the OxCGRT stay-at-home measure. As the value 1 is a recommendation "recommend not leaving house," we cannot distinguish recommendations from mandates, and, thus, the study is not included in the meta-analysis.
Sears et al. (2020); "Are we #stayinghome to Flatten the Curve?"	6-Aug-20	medRxiv	Find that SIPOs lower mortality by 29-35%. We use the average (32%) as our common estimate. Common standard errors are calculated based on estimates and standard errors from (Table 4) assuming they are linearly related to estimates.
Shiva and Molana (2021); "The Luxury of Lockdown"	9-Apr-21	The European Journal of Development Research	The estimate with 8 weeks lag is insignificant, and preferable given our empirical strategy. However, they use the 4-week lag when elaborating the model to differentiate between high- and low-income countries, so the 4-week lag estimate for rich countries is used in our meta-analysis. Common estimate is calculated as the average of the effect in Europe and United States, where the effect for each is calculated as (policy stringency - recommendation stringency) x estimate.
Spiegel and Tookes (2021); "Business restrictions and Covid-19 fatalities"	18-Jun-21	The Review of Financial Studies	We use weighted average of estimates for Table 4, 6, and 9. Since authors state that they place more weight on the findings in Table 9, Table 9 weights by 50% while Table 4 and 6 weights by 25%. We estimate the effect on total mortality from effect on growth rates based on authors calculation showing that estimates of -0.049 and -0.060 reduces new deaths by 12.5% 15.3% respectively. We use the same relative factor on other estimates.
Stockenhuber (2020); "Did We Respond Quickly Enough? How Policy-Implementation Speed in Response to COVID-19 Affects the Number of Fatal Cases in Europe"	10-Nov-20	World Medical & Health Policy	When calculating arithmetic average / median, the study is included as 0%, because estimates in Table 6 are insignificant and signs of estimates are mixed (higher strictness can cause both fewer and more deaths). We don't calculate common standard errors.
Stokes et al. (2020); "The relative effects of non-pharmaceutical interventions on early Covid-19 mortality: natural experiment in 130 countries"	6-Oct-20	medRxiv	We use estimates from regression on strictness alone (Right panel in Table "Regression results, policy strictness. Baseline is "policy not introduced within policy analysis period" in "Additional file"). We use the average of 24 and 38 days from model 5. There are 23 relevant estimates in total (they analyze all levels within the eight NPI measures in the OxCGRT stringency index). We calculate the effect of each NPI (e.g. closing schools) as the average effect in all of U.S./Europe. This is done by calculating the effect for each state/country based on the maximum level for each measure between Mar 16 and Apr 15 (e.g. if all schools in a state/country are required to close (school closing level 3) the relevant estimate for that state/level is -0.031 (average of -0.464 and 0.402). We assume all NPIs are effective for 54 days (from March 15 to June 1 minus 24 days to reach full effect). Standard errors are converted to common standard errors following the same process (this approach is unique for Stokes, as our general approach is not possible).

1. Study (Author & title)	2. Date Published	3. Journal	4. Comments regarding meta-analysis
Toya and Skidmore (2020); "A Cross-Country Analysis of the Determinants of Covid-19 Fatalities"	1-Apr-20	CESifo Working Papers	It is unclear how they define "lockdown." They write that "many countries [...] imposed lockdowns of varying degrees, some imposing mandatory nationwide lockdowns, restricting economic and social activity deemed to be non-essential," and since all European countries and all states in the U.S. imposed restrictions on economic (closing unessential businesses) and/or social (limiting large gatherings) activity, we interpret this as all European countries and all U.S. states had mandatory nationwide lockdowns. The effect of recommended lockdowns is set to zero in the meta-analysis, as only one country was in this lockdown category (i.e. too few observations, cf. eligibility criteria). The estimate for complete travel closure is -0.226 COVID-deaths per 100,000. Hence, if all of Europe imposed complete travel closure, the total effect would be $-0.266 * 748 \text{ million (population)} * 10 (100,000/1,000,000)$ equal to 1,690 averted COVID-19 deaths. However, according to OxCGRT-data European countries only had complete travel bans (Level 4: "Ban on all regions or total border closure") in 11% of the time between March 16 and April 15, 2020. So the total effect is $1,690 * 11\% = 194$ averted deaths. During the first wave 188,000 deaths in Europe was related to COVID-19 (by June 30, 2020), so the total effect is approximated to -0.1% in Europe and, following the same logic, 0% in U.S., where no states closed their borders completely. We use the average, -0.05%, in the meta-analysis. The estimate for mandatory national lockdown is 0.166 (>0) COVID-deaths per 100,000. Since all European countries (and U.S. states) imposed lockdowns, the total effect is 1,241 (553) extra COVID-19 deaths corresponding to 0.7% (0.4%). We use the average of Europe and the U.S., 0.5%, in the meta-analysis. Calculations of the effect of "Mandatory national lockdown" follow the same logic, but we assume 100% of Europe and United States have had "Mandatory national lockdown."
Tsai et al. (2021); "Coronavirus Disease 2019 (COVID-19) Transmission in the United States Before Versus After Relaxation of Statewide Social Distancing Measures"	3-Oct-20	Oxford academic	The study is not included in the meta-analysis, as they report the effect of NPIs on Rt which are not easily converted to relative effects.

Subject: Comments for the Immunizations Technical Advisory Group

External Email

Board members,

In regards to the upcoming TAG meeting considering COVID-19 for inclusion in chapter 246-105 WAC, I would like to provide a comment I sincerely hope you consider. I am a concerned mother with two young children. My concerns stated here are shared by my many friends and family members who are also parents.

According to the AAP, 12 million children have tested positive for COVID-19 since the beginning of the pandemic. For millions of children with natural immunity their risk of injury from COVID-19 vaccination outweigh the benefits.

We have absolutely no long term data on the teratogenic, neurological etc. effects this could have on our children. These vaccines do not prevent transmission and although they are shown to prevent severe disease and hospitalization (of which children are at extremely low risk), they do not offer robust protection against acquiring infection with the currently circulating Omicron variant. We do not know how they will perform with future variants.

There is an increased risk of myocarditis after covid vaccination which is seen on the FDA and CDC safety surveillance systems.

A Kaiser Permanente study found that for every million children vaccinated there was a myopericarditis rate of 208 cases.

Dr. Fauci recently explained that pediatric hospitalization rates are exaggerated by the detection of mild or asymptomatic infection secondary to universal screening. Additionally, a Stanford University study found that 45% of pediatric COVID-19 hospital admissions were unlikely to have been caused by SARS-CoV-2.

It is even harder to justify vaccinating our children when the Omicron variant is

associated with less severe disease and lower hospitalization rates.

Other countries have come to the wise decision against recommending covid shots for children (Sweden); and yet, this board is considering requiring it.

The Omicron variant, millions of children with natural immunity, the increased risk of myocarditis and no long term data on safety or efficacy in children makes a decision on this matter uncomplicated. Please do the responsible thing and leave this decision to the parents. It is not okay to just say parents can file for an exemption. There will be a multitude of parents who pull their children from public/private schools if this becomes a requirement. This is about the principle of letting parents decide, given the current and constantly changing information, what is best for their child.

Respectfully,

Marneye Driesen

As a concerned Washington resident, a patient educator and informed-consent advocate, and a parent of school-age children, I stand opposed to Covid vaccine mandates for children and implore you to oppose them as well.

Your own meeting notes admit there is no evidence regarding the effectiveness of vaccines in K-12 settings. Children are at extremely low risk from Covid, whereas the vaccines are still in the testing phase, and long-term side effects may not be known for many years. The evidence that IS available suggests that boys and young men may even be at more risk from vaccine-induced myocarditis than from Covid-19 itself. Mandates have the potential to cause MORE injury and morbidity to children than they prevent.

Parents care for their children's welfare far more than any third party ever could, and those who are concerned about their children's risk from Covid have had ample opportunity to have them vaccinated. At-risk teachers have also had ample opportunity to take advantage of vaccination to mitigate their risk. From this point on, informed-choice decisions about vaccination of children should be left to families.

I stridently oppose Covid-19 vaccine mandates for children and strongly urge you to do the same. It is not worth infringing upon families' medical autonomy for an intervention with questionable evidence supporting its efficacy.

Thank you,

Megan Minnick

External Email

WA State Board of Health,

I strongly oppose the discussion of covid-19 vaccine mandate for our children. Clearly this vaccine does not do its job as you see the up tick in cases in fully vaccinated individuals. The long term effects of this are unknown and until the full data comes out and time has passed this should not be required it should be a choice.

This is not okay. Let the parents decide what is best for their child. Children are not at high risk and as we have been seeing the vaccine does not do what it was set to do.

External Email

Hello,

I am vigorously opposed to the COVID-19 vaccine being added to the requirement for children's school and daycare and will move out of state if this is the case. COVID is shifting to an endemic disease, much like flu, and will be with us forever. The COVID-19 shot does not prevent infection or transmission and the vaccinated carry the same viral load as the unvaccinated. I will not be giving a yearly COVID shot to my child.

Thank you,

Rebecca Oshiro

Subject: Opposed to adding Covid "vaccines" to WAC 246-105

External Email

Dear members of the Washington State Board of Health,

In reference to your TAG meeting February 10, I want to register my vehement opposition to including the Covid-19 "vaccines" to the list of mandatory vaccines for children attending school.

A) Children are not dying on a grand scale from Covid. They do not need a "vaccine" against the disease. Especially one which releases large amounts of spike protein into their bodies.

B) The vaccines are still in the experimental stage, "Emergency Use Authorization" only. The adult population has been serving as guinea pigs. We've seen the inefficacy of these injections in the adult population, and do not need to inject these dangerous mRNA substances into the young population.

C) The pharmaceutical companies know that if the vaccines are approved or mandated for widespread use in children, they can move to being non-EUA by the FDA without threat of legal recrimination for damages related to these injections. Of course, Big Pharma is pushing for children to receive these injections!

Please beware of playing with the lives of our next generation in this way.

Sincerely,
Nancy Grunewald

Dear Board members,
As no long term testing has been done on these vaccines and there is plenty of evidence already of severe side effects and deaths from them, I think there is no need at all to add this to the list of required vaccines. In addition, school aged children do not contract Covid and suffer very little if they do. The risk assessment says the vaccines don't provide enough benefit to warrant them.

Dear Ms. Hisaw,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

STOP hurting these kids. Why are you not following the truth about this virus? A lot of lives are in your hands (all of you) on this board. Someday soon everyone will answer to God for what we all have done in this lifetime with what He has given us. Please start making the right choices. SO MANY are against this. Can you just listen to the people?

I don't know if you've received this yesterday or not.

Corrupted in WA,

I think we've all had enough of this "Rules for Thee, but not for me..."

When are you going to be giving up on this never-ending covid nonsense? Let our children breathe, get sick, get better/healthier, move on with their lives?

Are you also sick of the hypocrites at ALL levels? I am seriously glad that we will be pulling our children out of WA schools, moving to a free state and will letting them breathe. Very soon, expect to see our withdrawal letters being handed to the schools as they do not fight with us against this tyranny.

I want to send my kids to school without masks but they don't want to wear the 'school/medical masks'. I say, if they give you one, put it in your pocket, have them call me. I'm awaiting a call. No more!

Josh Daugherty

While the Unity Project has been laser focused on stopping the vaccine mandate for K-12 students bringing forth scientific experts and resources, we must widen our fight to include these tyrannical and illogical mask mandates.

There are groups across California and other states that have done amazing work fighting these mask mandates and we are with you when we say Enough is Enough!

Our children are wearing masks for 6-8 hours a day while Governor Newsom, other public officials and celebrities parade around maskless in a California venue that requires them. A venue with 70,000 people, in a state that is still "under emergency". This is not only hypocrisy in the highest degree, it's a blatant slap in the face and, in our opinion, the green light to stop sending your kids to school in masks if you haven't already.

Despite Newsom's poor attempt at an explanation for not wearing a mask, it's time to email and call your schools, principals, teachers and school board members letting them know you will no longer comply.

- * Send your kids to school without a mask, tell them they are heroes for standing up
- * Talk to other parents and get a group together, show power in numbers
- * Reach out to school leaders, let them know your child won't be wearing a mask
- * You can use the verbiage and links below that point to empirical evidence of the efficacy and harm that come from masks
- * Share your success stories, you will be an inspiration to others!

Please see the links below illustrating, with empirical evidence, that masks are not only ineffective (as stated by Fauci in the attached video), they are dangerous. It is time we take action. Stop sending your kids to school with masks on. Do not comply. The only way we end this mask mandate is by uniting and fighting these mandates together. Find your group of parents at your schools, look on our strategic partner page for groups near you and join with them. Protest the mask mandates together. Email and call your principals and school board members.

There is NO LAW that requires the masking of our children. There is not even a mask mandate. There is only a "guidance" from the CDPH which is linked herein.

Those of us that want/need them gone are in the vast majority. They only serve to prevent the infected person from transmitting their illness (with an N95 only) but such people/children should be kept home anyway. Our kids are suffering needlessly.

To Whom It May Concern-

I'm reaching out to see who and/or how I can find out more about plans for future mask mandates for K-12 and also the potential for vaccine mandates. I understand a Technical Advisory Committee has been formed regarding consideration of vaccine mandates, but I don't know what is going on on the mask facet.

That said, what is the best way for me to voice my concerns (which are strongly opposed to mandates and believe this should all be voluntary) and/or stay up to date with these items in terms of Department of Health plans/discussions/actions?

Thank you in advance,

Keith Kirby

2.

Please enter your comments or questions in the space provided below:

Caregivers & Parents Survey: COVID-19 Vaccine as a School Requirement Under state law (RCW 28A.210.140), the State Board of Health (Board) has the authority to create immunization requirements for child care and school entry. Since 2006, the Board has relied on multi-disciplinary technical advisory groups (TAG) to review vaccines against nine criteria to recommend to the Board whether an immunization should be added to the list of requirements. The Board recently directed its staff to work with the Department of Health to begin the process to collect the information necessary to convene a TAG to evaluate COVID-19 vaccine. The TAG will utilize the 9-criteria framework established by the Board to assess and evaluate the COVID-19 vaccine as a requirement for child care and school entry and provide a recommendation to the Board. As the preparation to convene the TAG is underway, Board and Department of Health staff would like your insight and feedback regarding the burden an additional school immunization requirement may create for parents, families, and caregivers. We recognize that getting kids vaccinated can include transporting children to medical appointments, taking time off work for those medical appointments, maintaining the child's immunization records, etc. Vaccine requirements for child care and school entry may also impact the health decisions that parents, families, and caregivers make on their child's behalf because parents must, at the very least, take the required vaccine into account. Since parents, families, and caregivers are often involved in obtaining vaccines for children, your feedback on this topic is essential. Knowing that adding COVID-19 vaccine as a requirement for school entry will impact families across the state, we are asking for your input on the barriers you may face to getting your kids vaccinated and how burdensome a COVID-19 vaccine requirement may be for you and your family. Feedback provided by survey respondents will be presented to the TAG for their consideration during review and discussion. However, the purpose of the TAG is to evaluate a vaccine against the established criteria to develop and provide a recommendation to the Board. The recommendation is then presented to the Board at one of its regularly scheduled meetings for consideration. The Board, at their discretion, may or may not approve the TAG's recommendation.

1.Organization or Community Affiliation La Center School District
2.Would adding COVID-19 vaccine as a requirement for school entry make you more or less likely to get your child vaccinated?
3.How burdensome would an additional immunization requirement for school entry be for you and your family?
4.What are some of the barriers you face to getting your child vaccinated against COVID-19? I will NEVER give my children this vaccine. It is made with aborted fetal cell lines. I absolutely object to this 100%.
5.What are some of the benefits you see to vaccination? Do the possible benefits of vaccinating your child against COVID-19 reduce the impact of identified

burdens of obtaining the vaccine? None. Children have a very powerful immune response and the virus is not dangerous to them. NO. 6. Do you believe adding COVID-19 vaccine as an immunization requirement for school entry is reasonable? Why or why not? ABSOLUTELY NOT REASONABLE. This vaccine does more harm than good to children. We will not accept the vaccine. Here is the note we got when attempting to submit this survey to you: "The maximum number of people have already responded to this form." But we still want you to have our responses.

3.

Subject: Comments for the Immunizations Technical Advisory Group

External Email

Judging by the agenda outline, it appears the TAG have already made up their minds. There are two "experts" in attendance that will support the TAG preordained decision. They are, after all, doctors and "experts". The same bunch that have recommended lockdowns and vaccinations that don't work.

It is being proven now. Today. A recent Johns Hopkins study found lockdowns and masks have done more harm than good, especially to children who have a 99.98% survivability rate from covid infection.

The vaccines and boosters are not proving effective long-term. The long term side effects of the vaccines in children are also unknown.

Where are the doctors who are against the experimental vaccine being given to kids? Why aren't they being asked to give testimony? Why aren't they being heard? Because they might give you real information, not the government provided narrative that can't be disputed or held up for examination.

Holding a vote when the outcome has been previously decided is disingenuous at best. Not inviting opposing viewpoints and information is dangerous and unscientific. Allowing the public to only see or hear the meeting but provide no feedback is shameful. These are our children, not yours. We make the decisions on their health and safety. You "experts" have had free reign for 2 years and it is now worse, not better.

Leave our kids alone. Let the parents and their children's doctors make the decision to vaccinate or not.

Stop doing more damage. Vote no and allow the parents to decide what's best for their children.

Sincerely,
John Pavlick
Concerned and frustrated parent.

Dear SBOH members,

Please provide your data and facts that you have stating that this vaccine PREVENTS the disease and REDUCES the risk of person to person transmission that is stated in criteria's 5 and 6 at the bottom of this email.

The CDC even states that the vaccine does not prevent people from getting the disease or reduces transmission. It may lessen some people's' symptoms and/or may keep some people out of the hospital if they contract COVID, but it is not necessary for children who are basically unaffected by either. This vaccine has known side effects and is not a one size fit all. Also, take note that the vaccine is for the original variant and not for the current or future variants.

Where there are risks, there should be a choice. I hope you take this into consideration during the meeting. America is the land of the free and parents should have the freedom to make medical decisions for their children.

Thank you,
Jennifer Edington

I am writing to comment about my concern that the DOH is considering adding the COVID-19 vaccination to the list of shots for school attendance. There is currently no published literature on pediatric COVID-19 vaccine effectiveness in the K-12 school setting. I do not think this is a safe idea for our children. If people want to get their children vaccinated with a new vaccine that has no research in young children they can do that but to make it a requirement to be in school is forcing people to use what is an emergency only basically experimental drug for that age group. Please consider that this is not in the best interests of the children at this time.

Thanks for your time and hard work.

Sincerely,
Heidi Ochsner

Dear Washington State Board of Health,

Our state government should NOT be mandating Covid vaccines on our children. Children are at extremely low risk for Covid and these medical decisions should be left in the hands of parents.

Sincerely,

The Citizens of Washington State

Dear State Board of Health,

Please, fix the current policy to reflect the updated science and remove the responses parents get from local school boards and superintendents that they are just following your guidelines. You are not elected officials and your inability to adjust policy to current science has done damage to this state and its children and continues to do more damage.

Please find your integrity to do your job and stop this draconian policy making that is causing far more harm than good and update your policy to reflect science and new information.

Denmark a similar size population to the State of Washington announced effective February 1, 2022, all restrictions are ending in the country. Funny such a small country has better genomic sequencing than the United States. So even with a growth in Omicron BA. 2 they are eliminating all Covid mandates and requirements.

When will Washington join the rest of the world and move forward from the Pandemic to an Endemic as vaccines do not stop the spread nor do they stop a person from getting multiple variants over time nor are they better at reducing hazard risk than natural immunity.

Please revise your policies and do what is right for the children of Washington as your constituents expect. Stop the pandemic of bureaucratic fear mongering and the US Hospitalization Trends is from your January 12, 2022, meeting presented by your Chief Science Officer. Kids have never been at risk and your own data presentation sourced from the CDC shows that.

Sincerely,

Tim Caldwell

Subject: RE: Covid-19 Guidelines and Actual Hospitalizations of Youth.

Dear Mr. Caldwell,

Thank you for your email. We appreciate the input from community members, parents, staff, and students. It is important to note that although there may be differences in the level of public support for the CDC or other public health agencies, K-12 public and private schools in our state are required to follow the K-12 Covid-19 Requirements <<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.doh.wa.gov%2FPortals%2F105-K12Schools2021-2022.pdf&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C06fde7ca309242541bc808d9e50229c9%7C11d0>> published by the Washington State Department of Health (DOH) in order to continue to provide in-person instruction. While we have advocated for changes in the guidance over the past many months, the mandate to follow the guidelines remains in place at this time. The most recent update was published January 26, 2022.

Sincerely,

John Polm, Ed.D.

Caution: This email came from outside the Puyallup School District. Do not reply, click any link or open attachments unless you have verified the sender.

Dear Superintendent Polm and Puyallup School Board Members,

Please see the attached documents including the letter to the CDC from Republican members of congress showing how little science is involved in the CDC policies. Additionally, from the CDC you will find attached a document showing actual hospitalizations by age group and as you can see children are in the bottom orange line. So, at no time was there a large group of children in the hospital due to the pandemic and your teachers, the Teachers' Union and others have promoted a narrative of fear instead of one based on actual data. Even during the less severe and more contagious Omicron variant there has been at most 4,400 children in hospitals nationwide or .008 percent of the 56 million school age children in America. In fact, according to the CDC data since August of 2020 a total of 85,369 people under the age of 18 with confirmed cases of Covid-19 have been admitted to hospital or .15% of all school age children under the age of 18 in the United States. There have been less than 883 deaths for the 18 and under age group in the United States based on CDC data through 1/22/2022 and 603 for school age children 5 to 18 years old out of 56 million school age children nationwide or expressed as a percentage of school age children .001%. Covid-19 is and never was a leading cause of death to youth and fear and stupidity have driven this response and bad policy. Sweden has decided not to vaccinate any school age children as they have an infinitesimal small risk of hospitalization or death.

You will also notice that a recent CDC study of Covid-19 Cases and Hospitalizations by Covid-19 Vaccination Status and Previous Covid-19 Diagnosis—California and New York, May-November 2021 showing the vaccine timeline and results that directly indicates graphically that Unvaccinated with previous Covid-19 diagnosis have less hazard rate than vaccinated, no previous Covid-19 diagnosis. Also Noted that by early October, persons who survived a previous infection had lower case rates than persons who were vaccinated alone. Why our leaders have chosen to ignore 100 years of the science of natural immunity is beyond me. Apparently making money at all costs was more important than practicing sound medicine and public health policy.

To summarize you are following guidelines that do not match science or studies that have debunked as deeply flawed and bad science such as is the situation with the Arizona study that the CDC keeps using to justify a mask mandate for children. At what point do

you and the board and the school district recognize the damage you are doing. Your policies are not backed by science. Maybe you want to start teaching the kids that the earth is flat again, leaches and bloodletting are modern medical procedures, or the sun rotates around the earth. Science is about replacing poor scientific theory with new conclusions backed by sound science and data. The time must be now for the removal of mandates that are not grounded in anything scientific, and you are proving why our district has a 38% rating in the science area when people cannot understand when one theory is debunked because it had no grounding in sound science. Below you will also find the Atlantic article that demonstrates the poor science the CDC masking policy is based on, and you are forcing on our children with little discernible benefit. Masks should be at best optional and surely not mandated as they do far more damage to kids and especially those in early elementary school learning to speak and read.

Summary

What is already known about this topic?

Data are limited regarding the risks for SARS-CoV-2 infection and hospitalization after COVID-19 vaccination and previous infection.

What is added by this report?

During May–November 2021, case and hospitalization rates were highest among persons who were unvaccinated without a previous diagnosis. Before Delta became the predominant variant in June, case rates were higher among persons who survived a previous infection than persons who were vaccinated alone. By early October, persons who survived a previous infection had lower case rates than persons who were vaccinated alone.

What are the implications for public health practice?

Although the epidemiology of COVID-19 might change as new variants emerge, vaccination remains the safest strategy for averting future SARS-CoV-2 infections, hospitalizations, long-term sequelae, and death. Primary vaccination, additional doses, and booster doses are recommended for all eligible persons. Additional future recommendations for vaccine doses might be warranted as the virus and immunity levels change.

By November 30, 2021, approximately 130,781 COVID-19–associated deaths, one in six of all U.S. deaths from COVID-19, had occurred in California and New York.* COVID-19 vaccination protects against infection with SARS-CoV-2 (the virus that causes COVID-19), associated severe illness, and death (1,2); among those who survive, previous SARS-CoV-2 infection also confers protection against severe outcomes in the event of reinfection (3,4). The relative magnitude and duration of infection- and vaccine-derived protection, alone and together, can guide public health planning and epidemic forecasting. To examine the impact of primary COVID-19 vaccination and previous SARS-CoV-2 infection on COVID-19 incidence and hospitalization rates, statewide testing, surveillance, and COVID-19 immunization data from California and New York (which account for 18% of the U.S. population) were analyzed. Four cohorts of adults aged ≥18 years were considered: persons who were 1) unvaccinated with no previous laboratory-confirmed COVID-19 diagnosis, 2) vaccinated (14 days after completion of a primary COVID-19 vaccination series) with no previous COVID-19 diagnosis, 3) unvaccinated with a previous COVID-19 diagnosis, and 4) vaccinated with a previous COVID-19 diagnosis. Age-adjusted hazard rates of incident laboratory-confirmed COVID-19 cases in both states were compared among cohorts, and in California, hospitalizations during May 30–November 20, 2021, were also compared. During the study period, COVID-19 incidence in both states was highest among unvaccinated persons without a previous COVID-19 diagnosis compared with that among the other three groups. During the week beginning May 30, 2021, compared with COVID-19 case rates among unvaccinated

persons without a previous COVID-19 diagnosis, COVID-19 case rates were 19.9-fold (California) and 18.4-fold (New York) lower among vaccinated persons without a previous diagnosis; 7.2-fold (California) and 9.9-fold lower (New York) among unvaccinated persons with a previous COVID-19 diagnosis; and 9.6-fold (California) and 8.5-fold lower (New York) among vaccinated persons with a previous COVID-19 diagnosis. During the same period, compared with hospitalization rates among unvaccinated persons without a previous COVID-19 diagnosis, hospitalization rates in California followed a similar pattern. These relationships changed after the SARS-CoV-2 Delta variant became predominant (i.e., accounted for >50% of sequenced isolates) in late June and July. By the week beginning October 3, compared with COVID-19 case rates among unvaccinated persons without a previous COVID-19 diagnosis, case rates among vaccinated persons without a previous COVID-19 diagnosis were 6.2-fold (California) and 4.5-fold (New York) lower; rates were substantially lower among both groups with previous COVID-19 diagnoses, including 29.0-fold (California) and 14.7-fold lower (New York) among unvaccinated persons with a previous diagnosis, and 32.5-fold (California) and 19.8-fold lower (New York) among vaccinated persons with a previous diagnosis of COVID-19. During the same period, compared with hospitalization rates among unvaccinated persons without a previous COVID-19 diagnosis, hospitalization rates in California followed a similar pattern. These results demonstrate that vaccination protects against COVID-19 and related hospitalization, and that surviving a previous infection protects against a reinfection and related hospitalization. Importantly, infection-derived protection was higher after the Delta variant became predominant, a time when vaccine-induced immunity for many persons declined because of immune evasion and immunologic waning (2,5,6). Similar cohort data accounting for booster doses needs to be assessed, as new variants, including Omicron, circulate. Although the epidemiology of COVID-19 might change with the emergence of new variants, vaccination remains the safest strategy to prevent SARS-CoV-2 infections and associated complications; all eligible persons should be up to date with COVID-19 vaccination. Additional recommendations for vaccine doses might be warranted in the future as the virus and immunity levels change.

Four cohorts of persons aged ≥ 18 years were assembled via linkages of records from electronic laboratory reporting databases and state-specific immunization information systems.¹ Persons were classified based on whether they had had a laboratory-confirmed SARS-CoV-2 infection by March 1, 2021 (i.e., previous COVID-19 diagnosis)⁵; had received at least the primary COVID-19 vaccination series⁶ by May 16, 2021; had a previous COVID-19 diagnosis and were fully vaccinated^{7,8}; or had neither received a previous COVID-19 diagnosis by March 1 nor received a first COVID-19 vaccine dose by the end of the analysis period. The size of the unvaccinated group without a previous diagnosis was derived by subtracting the observed groups from U.S. Census estimates.⁹ To maintain each defined cohort, persons who received a COVID-19 diagnosis during March 1–May 30, 2021, or who died before May 30, 2021, were excluded (to maintain eligibility for incident cases for all cohorts on May 30, 2021),¹⁰ as were persons who received a first vaccine dose during May 30–November 20, 2021. During May 30–November 20, 2021, incident cases were defined using a positive nucleic acid amplification test (NAAT) result from the California COVID-19 Reporting System (CCRS) or a positive NAAT or antigen test result from the New York Electronic Clinical Laboratory Reporting System. In California, person-level hospitalization data from CCRS and supplementary hospitalization reports were used to identify COVID-19–associated hospitalizations. A lifetable method was used to calculate hazard rates (average daily cases during a 7-day interval or hospitalizations over a 14-day interval), hazard ratios, and 95% CIs for each cohort. Rates were age-adjusted to 2000 U.S. Census data using direct standardization.¹¹ Supplementary analyses stratified case rates by timing of previous diagnoses and primary series vaccine product. SAS (version 9.4; SAS Institute) and R (version 4.0.4; The R Foundation) were used to conduct all analyses. Institutional review boards (IRBs) in both states determined this surveillance activity to be necessary for public health work, and therefore, it did not require IRB review.

Approximately three quarters of adults from California (71.2%) and New York (72.2%) included in this analysis were vaccinated and did not have a previous COVID-19 diagnosis; however, 18.0% of California residents and 18.4% of New York residents were unvaccinated with no previous COVID-19 diagnosis (Table 1). In both states, 4.5% of persons were vaccinated and had a previous COVID-19 diagnosis; 6.3% in California and 4.9% in New York were unvaccinated with a previous diagnosis. Among 1,108,600 incident COVID-19 cases in these cohorts (752,781 in California and 355,819 in New York), the median intervals from vaccination or previous COVID-19 diagnosis to incident diagnosis were slightly shorter in California (138–150 days) than in New York (162–171 days).

Before the Delta variant became predominant in each state's U.S. Department of Health and Human Services region (June 26 in Region 9 [California] and July 3 in Region 2 [New York]),¹² the highest incidence was among unvaccinated persons without a previous COVID-19 diagnosis; during this time, case rates were relatively low among the three groups with either previous infection or vaccination and were lowest among vaccinated persons without a previous COVID-19 diagnosis (Supplementary Figure 1, <https://stacks.cdc.gov/view/cdc/113253>) (Supplementary Figure 2, <https://stacks.cdc.gov/view/cdc/113253>). During the week beginning May 30, 2021, compared with COVID-19 case rates among unvaccinated persons without a previous COVID-19 diagnosis, COVID-19 case rates were 19.9-fold (California) and 18.4-fold (New York) lower among vaccinated

persons without a previous diagnosis; rates were 7.2-fold (California) and 9.9-fold (New York) lower among unvaccinated persons with a previous COVID-19 diagnosis and 9.6-fold (California) and 8.5-fold (New York) lower among vaccinated persons with a previous COVID-19 diagnosis (Table 2).

As the Delta variant prevalence increased to >95% (97% in Region 9 and 98% in Region 2 on August 1), rates increased more rapidly among the vaccinated group with no previous COVID-19 diagnosis than among both the vaccinated and unvaccinated groups with a previous COVID-19 diagnosis (Supplementary Figure 1, <https://stacks.cdc.gov/view/cdc/113253>) (Supplementary Figure 2, <https://stacks.cdc.gov/view/cdc/113253>). For example, during the week of October 3, compared with rates among unvaccinated persons without a previous COVID-19 diagnosis, rates among vaccinated persons without a previous diagnosis were 6.2-fold lower (95% CI = 6.0–6.4) in California and 4.5-fold lower (95% CI = 4.3–4.7) in New York (Table 2). Further, rates among unvaccinated persons with a previous COVID-19 diagnosis were 29-fold lower (95% CI = 25.0–33.1) than rates among unvaccinated persons without a previous COVID-19 diagnosis in California and 14.7-fold lower (95% CI = 12.6–16.9) in New York. Rates among vaccinated persons who had had COVID-19 were 32.5-fold lower (95% CI = 27.5–37.6) than rates among unvaccinated persons without a previous COVID-19 diagnosis in California and 19.8-fold lower (95% CI = 16.2–23.5) in New York. Rates among vaccinated persons without a previous COVID-19 diagnosis were consistently higher than rates among unvaccinated persons with a history of COVID-19 (3.1-fold higher [95% CI = 2.6–3.7] in California and 1.9-fold higher [95% CI = 1.5–2.3] in New York) and rates among vaccinated persons with a history of COVID-19 (3.6-fold higher [95% CI = 2.9–4.3] in California and 2.8-fold higher [95% CI = 2.1–3.4] in New York).

COVID-19 hospitalization rates in California were always highest among unvaccinated persons without a previous COVID-19 diagnosis (Table 2) (Figure). In the pre-Delta period during June 13–June 26, for example, compared with hospitalization rates among unvaccinated persons without a previous COVID-19 diagnosis, hospitalization rates were 27.7-fold lower (95% CI = 22.4–33.0) among vaccinated persons without a previous COVID-19 diagnosis, 6.0-fold lower (95% CI = 3.3–8.7) among unvaccinated persons with a previous COVID-19 diagnosis, and 7.1-fold lower (95% CI = 4.0–10.3) among vaccinated persons with a previous COVID-19 diagnosis. However, this pattern also shifted as the Delta variant became predominant. During October 3–16, compared with hospitalization rates among unvaccinated persons without a previous COVID-19 diagnosis, hospitalization rates were 19.8-fold lower (95% CI = 18.2–21.4) among vaccinated persons without a previous COVID-19 diagnosis, 55.3-fold lower (95% CI = 27.3–83.3) among unvaccinated persons with a previous COVID-19 diagnosis, and 57.5-fold lower (95% CI = 29.2–85.8) among vaccinated persons with a previous COVID-19 diagnosis.

Among the two cohorts with a previous COVID-19 diagnosis, no consistent incidence gradient by time since the previous diagnosis was observed (Supplementary Figure 3, <https://stacks.cdc.gov/view/cdc/113253>). When the vaccinated cohorts were stratified by the vaccine product received, among vaccinated persons without a previous COVID-19 diagnosis, the highest incidences were observed among persons receiving the Janssen (Johnson & Johnson), followed by Pfizer-BioNTech, then Moderna vaccines (Supplementary Figure 4, <https://stacks.cdc.gov/view/cdc/113253>). No pattern by product was observed among vaccinated persons with a previous COVID-19 diagnosis.

Discussion

This analysis integrated laboratory testing, hospitalization surveillance, and immunization registry data in two large states during May–November 2021, before widespread circulation of the SARS-CoV-2 Omicron variant and before most persons had received additional or booster COVID-19 vaccine doses to protect against waning immunity. Rate estimates from the analysis describe different experiences stratified by COVID-19 vaccination status and previous COVID-19 diagnosis and during times when different SARS-CoV-2 variants predominated. Case rates were initially lowest among vaccinated persons without a previous COVID-19 diagnosis; however, after emergence of the Delta variant and over the course of time, incidence increased sharply in this group, but only slightly among both vaccinated and unvaccinated persons with previously diagnosed COVID-19 (6). Across the entire study period, persons with vaccine- and infection-derived immunity had much lower rates of hospitalization compared with those in unvaccinated persons. These results suggest that vaccination protects against COVID-19 and related hospitalization and that surviving a previous infection protects against a reinfection. Importantly, infection-derived protection was greater after the highly transmissible Delta variant became predominant, coinciding with early declining of vaccine-induced immunity in many persons (5). Similar data accounting for booster doses and as new variants, including Omicron, circulate will need to be assessed.

The understanding and epidemiology of COVID-19 has shifted substantially over time with the emergence and circulation of new SARS-CoV-2 variants, introduction of vaccines, and changing immunity as a result. Similar to the early period of this study, two previous U.S. studies found more protection from vaccination than from previous infection during periods before Delta predominance (3,7). As was observed in the present study after July, recent international studies have also demonstrated increased protection in persons with previous infection with or without vaccination relative to vaccination alone^{39, 595} (4). This

might be due to differential stimulation of the immune response by either exposure type.¹¹¹ Whereas French and Israeli population-based studies noted waning protection from previous infection, this was not apparent in the results from this or other large U.K. and U.S. studies^{****} (4,8). Further studies are needed to establish duration of protection from previous infection by variant type, severity, and symptomatology, including for the Omicron variant.

The findings in this report are subject to at least seven limitations. First, analyses were not stratified by time since vaccine receipt, but only by time since previous diagnosis, although earlier studies have examined waning of vaccine-induced immunity (Supplementary Figure 3, <https://stacks.cdc.gov/view/cdc/113253>) (2). Second, persons with undiagnosed infection are misclassified as having no previous COVID-19 diagnosis; however, this misclassification likely results in a conservative bias (i.e., the magnitude of difference in rates would be even larger if misclassified persons were not included among unvaccinated persons without a previous COVID-19 diagnosis). California seroprevalence data during this period indicate that the ratio of actual (presumptive) infections to diagnosed cases among adults was 2.6 (95% CI = 2.2–2.9).¹¹² Further, California only included NAAT results, whereas New York included both NAAT and antigen test results. However, antigen testing made up a smaller percentage of overall testing volume reported in California (7% of cases) compared with New York (25% of cases) during the study period. Neither state included self-tests, which are not easily reportable to public health. State-specific hazard ratios were generally comparable, although differences in rates among unvaccinated persons with a previous COVID-19 diagnosis were noteworthy. Third, potential exists for bias related to unmeasured confounding (e.g., behavioral or geographic differences in exposure risk) and uncertainty in the population size of the unvaccinated group without a previous COVID-19 diagnosis. Persons might be more or less likely to receive testing based on previous diagnosis or vaccination status; however, different trajectories between vaccinated persons with and without a previous COVID-19 diagnosis, and similar findings for cases and hospitalizations, suggest that these biases were minimal. Fourth, this analysis did not include information on the severity of initial infection and does not account for the full range of morbidity and mortality represented by the groups with previous infections. Fifth, this analysis did not ascertain receipt of additional or booster COVID-19 vaccine doses and was conducted before many persons were eligible or had received additional or booster vaccine doses, which have been shown to confer additional protection.⁵⁶⁶⁵ Sixth, some estimates lacked precision because of sample size limitations. Finally, this analysis was conducted before the emergence of the Omicron variant, for which vaccine or infection-derived immunity might be diminished.¹¹¹⁹ This study offers a surveillance data framework to help evaluate both infections in vaccinated persons and reinfections as new variants continue to emerge.

Vaccination protected against COVID-19 and related hospitalization, and surviving a previous infection protected against a reinfection and related hospitalization during periods of predominantly Alpha and Delta variant transmission, before the emergence of Omicron; evidence suggests decreased protection from both vaccine- and infection-induced immunity against Omicron infections, although additional protection with widespread receipt of booster COVID-19 vaccine doses is expected. Initial infection among unvaccinated persons increases risk for serious illness, hospitalization, long-term sequelae, and death; by November 30, 2021, approximately 130,781 residents of California and New York had died from COVID-19. Thus, vaccination remains the safest and primary strategy to prevent SARS-CoV-2 infections, associated complications, and onward transmission. Primary COVID-19 vaccination, additional doses, and booster doses are recommended by CDC's Advisory Committee on Immunization Practices to ensure that all eligible persons are up to date with COVID-19 vaccination, which provides the most robust protection against initial infection, severe illness, hospitalization, long-term sequelae, and death.^{*****} Additional recommendations for vaccine doses might be warranted in the future as the virus and immunity levels change.

[†] Statewide immunization databases in California are the California Immunization Registry, Regional Immunization Data Exchange, and San Diego Immunization Registry; the laboratory system is the California COVID Reporting System (CCRS). In New York, immunization information systems include Citywide Immunization Registry and the New York State Immunization Information System; the laboratory system is the Electronic Clinical Laboratory Reporting System (ECLRS). California data were matched between the immunization and case registries using a probabilistic algorithm with exact match for zip code and date of birth and fuzzy match on first name and last name. New York data were matched to the ECLRS with the use of a deterministic algorithm based on first name, last name, and date of birth. In California, person-level hospitalization data from CCRS and supplementary hospitalization reports were used to identify COVID-19-associated hospitalizations.

[‡] For both classification into cohorts of persons with previous COVID-19 diagnoses and for measuring incident cases, laboratory-confirmed infection was defined as the receipt of a new positive SARS-CoV-2 nucleic acid amplification test (NAAT) or antigen test (both for New York and NAAT only for California) result, but not within 90 days of a previous positive result.

[§] Fully vaccinated with the primary vaccination series is defined as receipt of a second dose of an mRNA COVID-19 vaccine (Pfizer-BioNTech or Moderna) or 1 dose of the Janssen (Johnson & Johnson) vaccine ≥ 14 days before May 30, 2021.

^{**} Because of the timing of full vaccination, the cohort definitions, and analysis timeframe, this cohort consisted nearly exclusively of persons who had previously received a laboratory-confirmed diagnosis of COVID-19 and later were fully vaccinated (California: 99.9%, New York: 99.7%), as opposed to the reverse order.

^{††} Whereas vaccinated cohorts were directly observed in the immunization information system databases, unvaccinated persons without a previous COVID-19 diagnosis were defined using U.S. Census population estimates minus the number of persons partially or fully vaccinated by December 11, 2021, and unvaccinated persons with a previous laboratory-confirmed infection before May 30, 2021. In California, the California Department of Finance population estimates were used for 2020, and the 2018 CDC National Center for Health Statistics Bridged Race file for U.S. Census population estimates were used in New York, consistent with other COVID-19 surveillance reporting.

^{§§} In California, a person-level match was performed to exclude deaths in each cohort before May 30, 2021. In New York, COVID-19 deaths were removed in aggregate from the starting number of unvaccinated persons with a previous COVID-19 diagnosis on May 30, 2021.

Abbreviations: NA = not applicable; NAAT = nucleic acid amplification test.

* Statewide immunization databases in California are the California Immunization Registry, Regional Immunization Data Exchange, and San Diego Immunization Registry, and the laboratory system is the California COVID Reporting System; in New York, Immunization Information Systems include Citywide Immunization Registry and the New York State Immunization Information System; the laboratory system is the Electronic Clinical Laboratory Reporting System. California data were matched between the immunization and case registries using a probabilistic algorithm with exact match for zip code and date of birth and fuzzy match on first name and last name. New York data were matched to the Electronic Clinical Laboratory Reporting System with the use of a deterministic algorithm based on first name, last name, and date of birth. In California, person-level hospitalization data from the California COVID Reporting System and supplemental hospitalization reports were used to identify COVID-19-associated hospitalizations.

† For both classification into cohorts of persons with previous COVID-19 diagnoses and for measuring incident cases, laboratory-confirmed infection was defined as the receipt of a new positive SARS-CoV-2 NAAT or antigen test (both for New York and NAAT only for California) result, but not within 90 days of a previous positive result. Fully vaccinated is defined as having received a second dose of an mRNA COVID-19 vaccine (Pfizer-BioNTech or Moderna) or 1 dose of the Janssen (Johnson & Johnson) vaccine ≥14 days before May 30, 2021. Whereas vaccinated cohorts were directly observed in the immunization information system databases, unvaccinated persons without a previous COVID-19 diagnosis were defined using U.S. Census population estimates minus persons partially or fully vaccinated by December 11, 2021, and unvaccinated persons with a previous laboratory-confirmed infection before May 30, 2021. In California, the California Department of Finance population estimates were used for 2020, and the 2018 CDC National Center for Health Statistics Bridged Race file for census population estimates were used in New York, consistent with other COVID-19 surveillance reporting.

§ Cumulative cases per 1,000 persons.

¶ These summaries of cumulative incidence are estimated across a period of variability in the epidemic for all cohorts.

** Hospitalization data for New York are not included in this analysis.

Sep 19–Oct 2	25.0 (23.1–26.9)	61.9 (34.5–89.3)	99.4 (43.8–155.0)	2.5 (1.4–3.6)	4.0 (1.7–6.2)
Oct 3–16	20.8 (19.2–22.4)	56.3 (28.3–84.3)	58.5 (30.2–86.8)	2.7 (1.4–4.1)	2.8 (1.4–4.2)

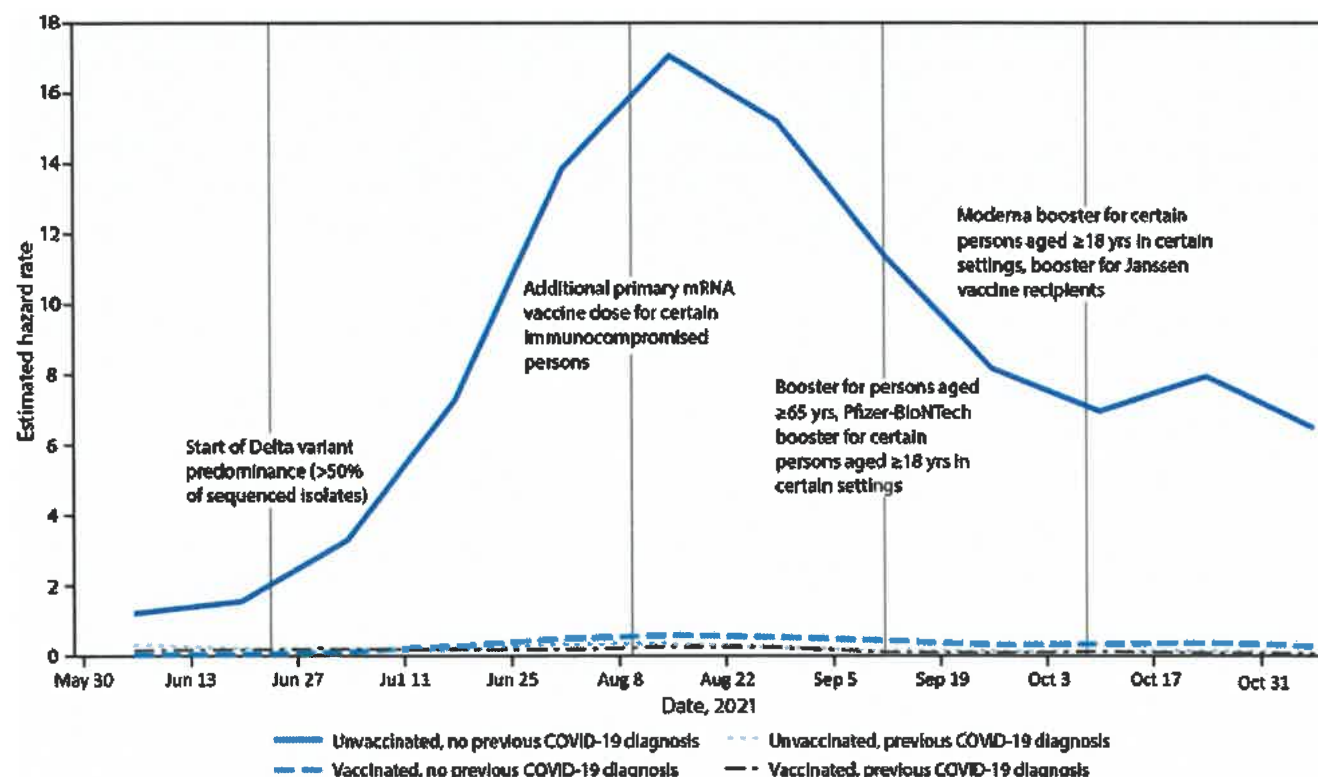

State and date range	Hazard ratio (95% CI) [†]				
	Unvaccinated, no previous COVID-19 diagnosis versus			Vaccinated, no previous COVID-19 diagnosis versus	
	Vaccinated, no previous COVID-19 diagnosis	Unvaccinated, previous COVID-19 diagnosis	Vaccinated, previous COVID-19 diagnosis	Unvaccinated, previous COVID-19 diagnosis	Vaccinated, previous COVID-19 diagnosis
Oct 17–30	21.5 (19.9–23.0)	56.5 (31.5–81.5)	92.1 (39.1–145.1)	2.6 (1.5–3.8)	4.3 (1.8–6.8)
Oct 31–Nov 13	22.7 (20.8–24.6)	70.7 (32.0–109.4)	86.1 (34.2–138.1)	3.1 (1.4–4.8)	3.8 (1.5–6.1)

* Life tables estimated at 7-day intervals for cases and 14-day intervals for hospitalizations.

† Hazard ratios and 95% CIs reported in this table differ numerically from presentation of corresponding results in the text as “X-fold lower” rates (i.e., a hazard rate of 1.0 is zero-fold lower). For example, a hazard ratio of 20.9 (95% CI = 18.9–22.9) for those “Unvaccinated–no previous COVID-19 diagnosis” versus “Vaccinated, no previous COVID-19 diagnosis” is equivalent to a 19.9-fold lower (95% CI = 17.9–21.9) rate for those “Vaccinated, no previous COVID-19 diagnosis” relative to those “Unvaccinated, no previous COVID-19 diagnosis.”

FIGURE. Incident laboratory-confirmed COVID-19-associated hospitalizations among immunologic cohorts defined by vaccination and previous diagnosis histories — California, May 30–November 13, 2021^{*,†}

Top
Return

* The SARS-CoV-2 Delta variant exceeded 50% of sequences in U.S. Department of Health and Human Services Region 9 (containing California) during the week of June 26. <https://covid.cdc.gov/covid-data-tracker/#variant-proportions>

† Estimated hazard rate is laboratory-confirmed COVID-19-associated hospitalizations per 100,000 person-days visualized at midpoint of each reporting interval.

Hello, Washington State Board of Health,

I am writing to you to request you not to put the Covid-19 Vaccination as a requirement for children to go to school in Washington State. You know that what you are requiring is against the constitution and against science. You know you are pushing this is against people's will. You know the Covid-19 vaccine is not a true vaccine and it has caused many injuries in young people and killed many. And you know that you are still pushing it is for your own benefit!!!! The blood will be on your hands if you continue participating in this evil.

The Right to Informed Consent is Meaningless Without the Right to Refuse Any Medical Intervention, Including Mandated Vaccination. Government Agents and those Acting Under Color of Law are Forbidden by Long-Standing National and International Law from Coercing Vaccination. Furthermore, this includes mask mandates and PCR testing. Children under the age of eighteen years of age need a parent's signature on any and all documents that deal with medical testing and this includes PCR testing in school.

From the attached Nonclinical Evaluation Report:

“Parturition: One ~ in the BNT162b3 group was euthanised on LDI showing hunched posture, pale, marked piloerection,

bleeding at the vulva, distended/purple abdomen. One ~ each in the BNT162bl and BNT162b3 groups were

euthanised due to all stillborn pups or total litter death. No macroscopic findings were noted in maternal necropsy.”

Fetal malformations/variations were found in the pups of dams in the treatment groups.

Also of concern:

Genotoxicity

No genotoxicity studies were conducted for the vaccine

Carcinogenicity studies were not conducted.

and are not listed on the TGA' s ingredient database.

ALC-0315 was more completely metabolized and only 50% was excreted

These data prove that the LNP are distributed systemically, not broken down efficiently, and stay in the body for a long period of time. Not only that, but the spike (S) protein expression can occur anywhere in the body, reaches high levels of expression, and may be of long duration (possibly mimicking the length of time antibody titers remain elevated.)

The biodistribution study is also very alarming because it shows the these LNPs accumulate not only at the injection site but also immediately to the liver, spleen, kidneys, and lymph nodes with rising concentrations (at 48 hours, the longest timepoint measured) in the ovaries, bone marrow, thyroid gland, pituitary gland, heart, and lungs. I can send you this study if you would like. I have not had time to curve fit and mathematically extrapolate the tissue concentrations to further timepoints.

Subject: COVID related restrictions and requirements for public school students

External Email

Hello,

I am writing to you not as a parent or a student in the Washington state public schools, but as someone who recently-ish (5 years ago) graduated from Interlake high school in Bellevue. I find the notion of requiring COVID vaccinations to participate in the public school system in Washington state deeply disturbing for the following reasons:

1. Students in the public school system are at the lowest risk of suffering due to COVID related symptoms. Rather, the greatest risk they face is an epidemic of mental health concerns, isolation, and suicide. Requiring a vaccination that is ineffective in preventing the transmission or contraction of COVID will only further isolate many students already at risk of the aforementioned health concerns.
2. The COVID vaccination is ineffective in preventing the transmission or contraction of COVID. While some symptoms may be reduced due to the vaccination, the vaccine does not serve to prevent the virus from spreading. As such, it is irresponsible to mandate a vaccine on students when the long term impacts of said vaccine are unknown. This is particularly true considering that students in the public schools are among the least at risk of serious complications due to COVID.

I hope that you will consider the views of concerned citizens (whom you govern with the consent of) as you discuss and strategize in how to move forward with public health in Washington State.

Cheers,

David

In response to your clarification for the meeting tomorrow, January 12, 2021 and subsequent meetings regarding vaccines for children:

There is no justification to mandate the covid vaccine for children age 5 and older. Nor is there a justification or need to require parents to file for an exemption. A parents' simple "no" to having their child be given the covid vaccine should close the matter. The decision and parental right to make the decision does not require your approval of an exemption. Nor does the risk to society outweigh the risk of the adverse effects of the vaccine.

I would ask the board to again review the under-reported VAERS data, increased cases of myocarditis, lack of definitive clinical trials, hidden vaccine contents, and future data. I would also remind the board this is not a "true" vaccine and only has EUA authorization which was inappropriate to begin with. Sincerely, Mary Sizer

Dear Ms. Haag,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

From: David Rubino <tigger@live.com>
Sent: Tuesday, January 11, 2022 11:13 AM
To: Donahoe, Kaitlyn N (SBOH) <kaitlyn.donahoe@sboh.wa.gov>
Subject: It's critical to preserve the personal/philosophical exemption

External Email

Kaitlyn,

I believe the covid-19 vaccines are more harmful to children than they are helpful and should never have been approved for kids. As a medical professional, you probably know or suspect this is true. At the very least, you know the trials did not have the statistical power needed to prove the vaccine is safe when compared to the miniscule risk to children from covid.

At the same time, the pressure to require the covid-19 vaccine in school is enormous, because not doing so appears to align yourself with people who are "anti-vax" and more generally with Republicans, which you may not be or may not wish to be known for. Requiring the vaccine for school children seems inevitable in a "blue state" and taking a stand will cause damage to your reputation and career, and maybe your income and family well-being... and it won't change anything. The governor will remove you from the Board if needed to ensure this policy is put into place.

It seems likely that you will approve the school vaccine mandate knowing it will kill a few children, and hurt a few more... and I understand why.

What I ask of you, therefore, is that you insist on keeping the personal/philosophical exemption in place for the covid-19 childhood vaccine. This will allow parents who wish to protect their children from harm to do so, without forcing us to withdraw them from school.

And make no mistake... hundreds of thousands of kids will vanish from school if you do not allow the personal/philosophical exemption. No manner of pressure or threat of punishment will force us to harm our kids knowingly, and the damage to schools,

families, and communities will be incalculable.

Please, do the less wrong thing that protects my kids, keeps them in school, and preserves your career as well. It's all I ask in these difficult times.

Thanks,

-David Rubino

DROP THE COVID-19 ISSUE AND LAY OFF RESTRICTIONS!!!
(We are going on three years of this nonsense and I do believe that IF this was such a safety concern, the SUPER BOWL would even be still considered in your damn restrictions!)

The face masks are a joke!
The lab technicians in Wuhaun, China wore HAZMAT suits from head-to-toe.
The 6 ft social distancing is a joke!
This whole damn thing is a joke! Ha! Ha!
It's time you people STOP with your BULLSHIT and leave people ALONE!
If citizens wanted the 'jab', they would be seeking it out.
STOP! FORCING PEOPLE TO DO WHAT POWER-TRIP YOU'RE ON!!!!

Signed,
Christina M Chappell

I urge you to please refrain from mandating covid vaccination in WA students. Please consider the legal and ethical consequences related to mandating an experimental vaccination and the significant damage that may result from forcing children to receive an experimental drug that lacks long-term safety data and has not been extensively studied in children. I urge you to please consider the fact that Covid vaccination does not prevent infection nor prevent one from spreading the virus to others. Please consider that the record high numbers of Covid cases currently happening in our schools is clear evidence that increasing Covid vaccination rates in school age children is showing a direct positive correlation with increased covid cases in our schools.

Finally, please be cognizant of a parent's legal and ethical right to informed consent and individual autonomy regarding their child's health care. Parents should be able to choose for themselves what they feel is best for their child and should never be coerced and forced into giving their child an experimental therapeutic that lacks safety data in children and is proving to be ineffective in reducing rates of Covid-19 in our schools.

Please do not mandate Covid vaccination for children to attend school. Please refrain from making unethical, and immoral decisions to force this experimental vaccine on students.

Thank you for your consideration.

To whom it may concern,

I am a concerned parent in the state of WA. I have three children and pay taxes to the state for their education. I do not in any way approve of mandating the covid-19 vaccine in schools. My children are not in danger of dying from covid-19. They have a less than 1% chance of doing so. They have been exposed to covid on multiple occasions and have no more than a sniffle. Injecting them with a vaccine that does more harm than good to their system to fight against something that isn't a danger to them is irresponsible and dangerous. Please say no to this mandate and give the parents of this state the ultimate say in what goes into their children's bodies. We should not have to sacrifice their health for their education.

Thank you,

Lacey B.

Ref: Parent and Caregiver Survey. My school district, Lynden, sent out your survey to all guardians of students. I tried to submit my form response but it failed saying that the max participants had already responded. I have no doubt that my politically charged community responded with break neck speed. But I also wanted to share my perspective with your admin from someone who lives in the Lynden School District, loves my community, and votes in the minority. My household is fully vaccinated and boosted. Your survey asked why-my answer is that I believe in healthcare and prevention and reducing the likelihood of a fatal outcome and spreading it to others. Your survey asked about a vaccine requirement- my answer is no, because I still believe in the power of choice and freedom from forced vaccinations. I highly support recommendations from the experts but reject the idea of forced vaccinations in exchange for an education. I personally feel that it's irresponsible to not protect your children medically but I would not force my opinion on another family. Parents and students should be allowed to form their own decisions, while the government can offer alternative learning modules and methods-even if it's shifting to online or magnet /charter school type instruction. It's ridiculous that public education is so far behind in offering alternative methods that meet the needs of all students especially special education. LIVE streaming should be automatic and in every classroom so that students who are ill, traveling, chronically ill have equal opportunity and access to learning. I am very happy to chat with anyone about suggestions or concerns. Thank you for your time.

Subject: WSDOH is lying to you!

External Email

Before you mandate vaccines you should get a true report on the breakthrough cases.

The Washington State Department of Health is Lying to You!
Here is the Smoking Gun!

This is a somewhat detailed report. Actually it wasn't that hard to expose their lies.

They are deciding on "Vaccine Mandates" on false information and now it is criminal!

<https://jetero.wixsite.com/kitsapcountyreport/the-wsdoh-is-lying-to-you-yes-here-is>
<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fjetero.wixsite.com%2Fkitsapcountyreport/the-wsdoh-is-lying-to-you-yes-here-is&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C8890611dc6194ba9473508d9ebd68f77%7C11d0e2172>>

You can see that King County gives the actual breakthrough numbers.

99.7% of the cases recover and are naturally immune and don't need a booster! Who does that hurt? Gov and big pharma! Where do you think those billions go? Right into the pockets of big pharma and the health departments.

The vaccine does not work!

WSDOH has finally issued a report after 3 weeks and sadly it is a complete mess. They are lying on the report, and it cannot be trusted. I assume the trends of King County are representative of the state.

King County COVID Breakthrough Report!

As you can see the cases are equal with both the vaccinated and unvaccinated which makes you wonder why King County has a vaccine mandate.

Breakthrough Cases: The Fully Vaccinated that Get COVID!

King County somewhat honestly presents the breakthrough data by including the actual numbers. They still present it as comparison to the unvaccinated which gives a biased view. WSDOH data is on a different report and is marginally useful. KPHD actually manipulates the data to favor the vaccine.

You will not see this type of analysis anywhere else. It should be everywhere.
You can see the vaccine is marginally effective.

This is important information when they are mandating all be vaccinated. Do these statistics warrant a vaccine mandate?

The vaccinated are spreading and getting the virus, going to the hospital and dying at a significant rate.

The only people that are truly safe from the virus are the naturally immune and those that have been tested in the last 72 hours.

Those with one Pfizer or Moderna injection or have not waited the two weeks are not included in the fully vaccinated, yet they are included in the unvaccinated.

If someone dies of the vaccine there is no record. We need three categories for the deaths!

Week Ending 1-27-22 – 12,054 Cases 54% of the Cases

Week Ending 1-27-22 – 161 Hospitalization 43% of the Hospitalizations

2 Weeks Ending 1-27-22 – 39 Deaths 49% of the Deaths

They update it weekly!

<https://kingcounty.gov/depts/health/covid-19/data/vaccination-outcomes.aspx>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fkingcounty.gov%2Fdepts%2Fhealth%2Fdata%2Fvaccination-outcomes.aspx&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C8890611dc6194ba9473508d9ebd68f77%7>

Kitsap county has decided to revamp their breakthrough reports on the last week of the year when the breakthroughs are soaring. How convenient!

Kitsap County 52% of the cases are vaccinated.

Nov -Dec

Fully Vaccinated 1207

Unvaccinated 1116

These come from the Washington State Report Jan 5 and Jan 12 Report.

You can get the Jan 12 report here. I will send you the Jan 5 report

Both are PDFS!

I would have liked to send a group email to all ten members of the board with this link. As that apparently is not possible, in true non transparency spirit of government, I guess I have to send it to this generic email so it can be memory holed and never read by anyone. How ridiculous.

To The Washington State Board of Health and the Public It Serves:(Please Post)

We the free and united people of America and the world are writing in regards to the unlawful and corrupt actions taken by the healthcare industry, bureaucrats, and media regarding COVID-19. The actions taken for nearly two years have stripped people of their rights, decimated the US Constitution, violated the principles of international law embodied in the Nuremburg Code and ignored basic and inalienable human rights. The people behind this have leveraged their privileged positions to make billions of dollars at the expense of humanity, and we are unwilling to allow this to continue.

For decades, the field of public health has researched the use of fear as a tool to manipulate people into action. The use of that tool has now been perfected and implemented against the people of the world with COVID-19. Evidence of this knowledge can be found in a CDC presentation, other DHHS materials, and in numerous academic journals. The intentional use of fear to sow hate, division, and discord is unethical, unacceptable, and must stop immediately. The reality is that COVID-19 has a 99%+ recovery rate in most of the population and approximately a 94% recovery rate in the most vulnerable. Compare this to the original SARS which had approximately a 9% case fatality rate and the original MERS which had over a 30% case fatality rate. We did not lockdown, mask, or even widely acknowledge these diseases when they were prevalent despite the fact that they had similar rates of spread to COVID-19. This fear has been used as a marketing tool to attempt to justify previously unthinkable actions by bureaucrats and public health figures around the world; the most egregious of which is the forced injection of gene therapy drugs into healthy people. Gene therapy literally alters the 1 genetic makeup of a human being and simply cannot legally, morally, or ethically be forced on anyone, ever. If the decision to alter one's own genetic makeup does not rest with the individual, then, there can be no argument that freedom is lost. Not only are the COVID "vaccines" admittedly a gene therapy, they are inarguably unsafe.

The swine flu vaccine was pulled from after just over 20 deaths, and the Chevy Volt was recently recalled over the potential for battery fires; but the Pfizer shot was given expanded authorization despite the high recovery rate from COVID-19 and the fact that Pfizer's own documents, submitted to the DHHS show that over 1200 people died in less than the first 3 months of authorization. This is nothing more than corruption. The COVID shots are also ineffective. A recent Department of Defense document stated that 71% of new cases of COVID-19 in the Medicare population are in fully vaccinated individuals and 60% of hospitalizations are in the fully vaccinated. This same document also stated that the injections are even less effective in North American Natives, Hispanics, and "Blacks" (the document apparently was unconcerned with political correctness).

If the 1 Moderna acknowledged in SEC filings that mRNA technology is a gene therapy. This has also been acknowledged in documents from Pfizer and by numerous scientists. If “vaccines” do not stop the spread, do not stop hospitalization, alter our genes, and have not even existed long enough for long term testing, why are we attempting to violate people’s inalienable rights by forcing them? The fact is that facets of our government are now moving ahead as quickly as possible with these COVID shots. We are even authorizing them in children despite the fact that people under 30 are at ZERO statistical risk of death from COVID-19. and the shots appear far more dangerous to children than the disease. Further, we are doing this with no transparency. The DHHS has done everything possible to cover up the side effects and dangers of these injections, even going so far as to request 55 years to release the documents they relied upon to authorize/approve these deadly injections.

How can informed consent be given without a true understanding of the risk? This situation is untenable and we demand that it be remedied. We the free people of this nation and world will no longer comply with mandates that fail to consider our inalienable rights. In the spirit of Martin Luther King, Gandhi, and Jesus Christ we will spread our message through peace and we will resist peacefully, but make no mistake, we WILL resist.

The accompanying presentation found at www.renz-law.com
<<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fwww.renz-law.com%2F&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Ce4665561f7e04623c4ee08d9e6e3be3b%7C>>
supplies you with additional data to demonstrate everything stated here. We now demand the following from our elected leaders, and vow to remember your actions or inaction when it comes time to vote and donate:

1. The resignation/termination of Anthony Fauci and civil/criminal investigation of his actions by a truly INDEPENDENT prosecutor;
2. The criminal and civil investigation of those involved with any gain of function research that may have been responsible for the creation of SARs-COV2;
3. Investigations – criminal and civil – into the deceptive and misleading push for the gene therapy injections that have been falsely labeled as vaccines (only after the definition of “vaccine” was changed); a. This should include RICO and fraud claims (as is appropriate) involving the “Trusted News Initiative”, the drug companies, hospital systems, and some government actors;
4. Transparency legislation that gives the public immediate access to the raw data and submitted documents related to the shots and COVID “pandemic” – If there is nothing to hide, NO ONE should oppose transparency; a. This should be passed on the state level as well;
5. Liability for injury from vaccines under the same rules as any other product – if they are safe, there should be no opposition to liability to help those that have been injured;
6. Legislation that recognizes the absolute right to reject medical treatment or vaccination of any type for ANY reason;

7. NO funding for state/federal contracts with ANY organization that discriminates based on vaccination or health status;

8. Funding for the hundreds of thousands of individuals injured by job loss and "vaccine" injury;

9. NO on vaccination status tracking legislation; and

10. Our local law enforcement to uphold their oaths to uphold the Constitution and refuse to enforce unconstitutional mandates and rules.

I am emailing you in reference to the voting that is taking place today on the Covid 19 mandate for children to enter schools.

I strongly oppose this mandate. I will be home schooling if this takes place in our state- which will pull me away from my full-time Clinical Practice.

The risk for children is low for Covid-19 but the risk they are taking with the vaccination runs high (we now know there is a high risk of myocarditis).

If teachers feel unsafe they should mask and vaccinate.

Please consider all facts before voting today.

Thank you for your time.

If an entire nation is NOT going to isolate there + & - Covid-19 w other health issues in hospital!

Then why should there be forced quarantine and isolation camps ect. In our state of WA that is neighbors with Canada? Get rid of all WAC pertaining to forced quarantine and isolation.

Sincerely

To warrant adding Covid Vaccines to the schedule of vaccinations for school enrollment one fundamental question must be asked and verified: Is there a risk of this disease causing death to the child? The CDC has answered this question in their own data - school-aged children have a 0% mortality rate to Covid. The data is clear and unquestionable - vote NO to adding Covid vaccines to the regular schedule.

FYI: VAERS Death Count 22,000+
Injuries 1M+

Subject: Attn: TAG K-12 Covid shot Mandate- Teachers Union prime driver of vaccine mandates

External Email

Dear TAG,

Did you know the Teachers Union donates millions of dollars to political campaigns and is a prime driver in the vaccine mandates for school aged children? Teachers Unions are not qualified to and should not be making this decision for our children.

According to the CDC children are at a statistically 0% risk of serious illness or death from Covid. The CDC also acknowledges, the vaccines do not prevent infection or transmission of the virus. Vaccine efficacy against Omicron is down to 27%, far below the 50% threshold required for FDA approval. Therefore, there is no need to vaccinate children against Covid.

On the other hand, there have been 41 reported deaths after COVID-19 vaccine among children aged 0 to 17. There have also been 602 reports of myocarditis and pericarditis and 51 reported cases of blood clotting disorders among children. It is evident that these vaccines carry serious risks for children.

Vaccine mandates override the right to provide informed consent for this medical intervention by not allowing patients or parents to make their own decisions. Considering the low Covid-related risks for healthy children, the risks associated with the vaccine, declining vaccine efficacy against new variants, the protection from any liability for vaccine manufacturers, it should absolutely be the right of every parent to decide whether to vaccinate their child.

Please do the right thing and let there be Choice with Covid vaccines.

Sincerely,

Theresa Lane

To Whom It May Concern:

We are very concerned about children having to be vaccinated. We adopted our son when he was 7 years old and knew nothing about his medical history. He seemed to be a fine healthy boy. When we got him he was all caught up with his vaccinations and didn't think much about it. Well, when he was 12 years old we had him take the flu vaccination and the Meningococcal and Td/Tdap booster. A few months later he got really sick from the flu. He had never been sick since we had him other than just sometimes a runny nose but never a temperature or throwing up or really sick. He was sick for 7-8 days and missed school for a week. He ended up having a temperature for 3 days and throwing up and just not feeling well for a while. After that about a month later, he slowly ended up with ticks and jerks and slowly got worse and worse. We were really concerned but didn't know what could be done about it. Fortunately, the ticks and jerks slowly went away but it took about 3 months for the symptoms to go away. We had no idea if this was going to be a permanent thing or not. I looked back in his records to see if anything like this had happened to him and found that he also ended up with ticks and jerks also the year he had 8 shots injected that year as well and this was a couple of years before we adopted him. Both times he ended up with the ticks/jerks, he had vaccinations.

Just recently a life insurance company also found out that there was an increase of deaths by 40% with people between 18-64 years old. Now, remember an insurance company does not want this to happen since they have to pay out and this was last year. There is such concern for the vaccinations that if you force parents for the kids to have them, you don't realize the medical issues or deaths and the heartache you are creating for the parents and especially for the children. If you truly care about the children, you will not force these vaccinations on the children to go to school.

If they had mandated these vaccines on our kids last year, I would have definitely pulled my child out of school and homeschooled him or sent him to a private school. Once you have a vaccine injury, you can't undo the damage and we all know Covid isn't killing kids like the media wants to portray it is. Please have some humanity and dignity for the people you say you care about. If you mandate the vaccines and give the parents no choice then the death and injuries are on you but if you give the parents the choice then that guilt is on the parents.

Thank you for taking the time to listen.

Subject: No to COVID Vaccine Mandates for Public Schools

External Email

To the Washington State Board of Health,
I am writing to you to ask that you do not make the COVID vaccine a mandate in order for children to attend public school and here is why:

- * The vaccine has only been approved for emergency use only at this point.
- * There are no long-term studies on the side effects of the vaccine and we don't know what kind of harm it could cause our children in the future.
- * We know that there is a risk for teens and young adults to get myocarditis and pericarditis from the vaccine.
- * Kids are not dying from COVID.
- * The vaccine does not stop the spread of COVID nor does it prevent someone from getting COVID.
- * This is not a vaccine like the Measles, Mumps, Polio, Chicken Pox and it shouldn't be required just like the flu shot is not required.
- * This should be a parent decision on whether or not a child should take have the vaccine.
- * There has already been about 40K children removed from public schools within the last year, if you make the vaccine a requirement you are going to see thousands more.

Thank you for taking the time to hear my concerns and the concerns of many other Washington parents.

Regards,
Katy Radelich

Dear BOH:

Please share with your TAG committee:

Response to # 5-6 on your criteria:

The sub set that has significant morbidity is 80+ year old people in nursing homes! All other age groups DO NOT have significant morbidity, especially school age children.

We could just as well extend your logic to protect the elderly by murdering all the children so there would be ZERO transmissions by children.

Again I ask, how much money is the health care industry receiving from the government to encourage you to sacrifice children for a EUA so-called vaccine with significant adverse reactions and NO ACCOUNTABILITY for vaccine makers, and NO TRANSPARENCY in their clinical trial data.

Stop this attempt to get children on a vaccine schedule that will insure no liability.

External Email

To whom it may concern,
I am reaching out to you today in regards to the consideration of covid vaccines for school children. I deeply understand the need for the safety of children and teachers however, this vaccine does not stop transmission or prevent sickness. I cannot understand and just cannot wrap my mind around why we would even consider this type of vaccine for our children without the true test of time. The damage that could be done is irreversible. Choosing to vaccinate your child based on your own families health and circumstances is one thing, considering it a vaccine (which it is NOT) needed for school is quite another. The risks deeply out weigh the benefit and it is my hope and prayer that you will NOT consider a covid vaccine for any school children. Thank you.

Subject: Concerns with parent/caregiver survey

External Email

Good morning!

This morning, someone shared the TAG survey to assess and evaluate the COVID-19 vaccine as a requirement for entry to schools and child care. I understand the survey closes today, and wanted to share two concerns.

First, many of us weren't aware that this survey existed. We would have been happy to support outreach in our own communities, which include parents, families, child care providers, community based organizations, school administrators, and other caregivers.

Second, it appears that the survey is only offered in English. The disparities in health and other outcomes as a result of the pandemic are extensive and well documented. Offering this survey only in English effectively means you will not hear the voices of families who aren't native English speakers – a significant and important portion of our communities.

I hope you'll consider re-issuing this survey, and working to ensure it is accessible and shared with a diverse range of families and caregivers. If you'd like to talk more, please let me know.

Best,

Jessica Tollenaar Cafferty

Re: February 10, 2022 agenda item - adding Covid 19 vaccinations to required list for students.

The prudent thing to do would be waiting to see study results regarding natural immunity and some longer term studies regarding vaccine adverse reactions. These are our children, tomorrows leaders. Let us safeguard them until we have more information. Does anyone know how many children were in the test group before the emergency use authorization was granted?

A Covid-19 vaccine mandate clearly does not pass the 9 criteria required when Reviewing Antigens for Potential Inclusion in WAC 246-105-030. I am not taking issue with the vaccine itself, and in fact continue to encourage vaccination in my community. My lack of support for a mandate stems from the following criteria not being met under sections II and III on the list of criteria:

II. Disease Burden Criteria

5. The vaccine containing this antigen prevents disease(s) that has significant morbidity and/or mortality in at least some sub-set of the population.

- The vaccine has been directly available to every vulnerable sub-set of the population for some time.

6. Vaccinating against this disease reduces the risk of person-to-person transmission, with transmission in a school or child care setting or activity being given the highest priority.

- It is widely proven that vaccinated individuals can and do continue to transmit the virus. We know this because this was the science used to justify mask mandates. Masks are mandated in schools already, regardless of vaccination status, to prevent the vaccinated from transmitting the virus.

III. Implementation of the Criteria

7. The vaccine containing this antigen is acceptable to the medical community and the public.

While the vaccine may be acceptable to the medical community (although we will note that even within the medical community, the vaccine adoption rate was not acceptable enough to preclude a forced mandate), we cannot gloss over the fact that public acceptance does not even represent a strong majority.

- Under 51% of Spokane County residents are vaccinated. (srdc.org <<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fsrdc.org%2F&data=04%7C01%7C>>)
- Less than 40% of kids 12-17 are vaccinated. (srdc.org <<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fsrdc.org%2F&data=04%7C01%7C>>)
- Only 36% of the entire black community in Spokane County is vaccinated, and it is reasonable to assume this number is far lower among ages 12-17. A vaccine mandate in schools would disproportionately affect students of color in our community. (srdc.org <<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fsrdc.org%2F&data=04%7C01%7C>>)

8. The administrative burdens of delivery and tracking of vaccine containing this antigen are reasonable.

- Our administrators and nurses have already given feedback that a vaccine mandate would create an unreasonable and insurmountable administrative burden involving tracking.

9. The burden of compliance for the vaccine containing this antigen is reasonable for the parent/caregiver.

- As stated in the above vaccination statistics, parents are choosing not to vaccinate their children. Forcing them to do so (as with other segments of our society who were coerced under the threat of losing their jobs and livelihoods) does not fall within a reasonable burden of compliance. It does not seem logical to vaccinate a group (ages 0-19) with such a low, even insignificant, rate of hospitalization or death, while claiming that will protect a more vulnerable group (ages 50-90) with a dramatically higher rate of vaccination (between 62%-82% based on age). Thusly, our state would propose forcing vaccination on those who do not need it, to protect those who already have it and/or could easily get it.

The vaccine is widely available to any age group now. Vaccination rates reflect individual health choices that must be protected. We have to acknowledge that individuals can make their own health decisions for themselves and their families. There simply is not a case to be made for forcing someone to get vaccinated to protect someone else who can easily get vaccinated themselves.

Hello,

As a parent I do not feel comfortable allowing my children to get an injection of a new vaccine or medication that has not had any long term studies done on it. The Covid vaccine has not been used long enough to properly know what if any long term side effects it may cause. I do not want to find out years from now that there are side effects that are serious and we shouldn't have given this to our children. It is just too new to know! We must not mandate this vaccine for children who have a much greater risk of death from suicide than Covid! Please do not let this vaccine become part of the required immunization schedule, it is just too new and frankly not necessary!

Sincerely,
Jackie Purvis

Subject: mRNA Drugs

External Email

Good Day,

I trust you are all aware that a suit has been brought in the World Court against the primary promoters of these dangerous gene therapy drugs. The plaintiffs, promoters and participants in this suit are world class professionals with incomparable credentials. There is no fake news, misinformation or radicalism involved. The promotion and advancement of these drugs is shameful at any level. Fully mRNA "vaccinated" people contract, spread and die from the COVID virus. Our health system denies early treatment until a COVID patient can be given more dangerous, ineffective and expensive drugs just before they become a death statistic. This blind push for all to receive as many patented drugs as possible must stop. Health and healthy living does not and will not come from a needle. Can you for a moment please consider how a country, indeed world, can go all in on a drug with unknown efficacy and side effects and deny the use of known safe and effective drugs. mRNA drugged people are suffering horrible adverse reactions and the full extent of this carnage is not yet known. Post mRNA introduction all cause deaths are up dramatically. It truly is insanity. That anyone would even consider giving these drugs to children is criminal. A human under 70 years of age is far more likely to die from the drugs than the virus. Please stop the poisoning.

Sincerely,

Garry Blankenship

I am emailing you today to let you know that my family believes that the COVID-19 shot should be a choice not mandatory for children to go to school. I would appreciate a strong hard no for mandating an experimental gene therapy on anyone let alone our most vulnerable. Can you guarantee that the long term side effects won't be damaging to them in the future? You are playing Russian roulette with these children's lives. I will pray for you to find it in yourselves to make the choice not to mandate these on our children. This will ultimately be on your hands if things go extremely bad. Are you able to live with that responsibility?

Thank you

Julie

Subject: HB 1684 Fluoridation

attachments\E59884BAE715484F_HB 1684 Fluoridation 2 1 22 Osmunson (1).pdf

External Email

Dear Washington State Board of Health, Keith Grellener, Tom Pendergrass, Elisabeth Crawford, Temple Lentz, Vazaskia Crockerell, Fran Bessermin, Bob Lutz, and Umair Shah,

The Legislature has asked the Board of Health for advice on HB 1684 Fluoridation to be provided within 10 days. Ten days is not enough time for the smartest person in the world to carefully review all streams of evidence on all sides. Tradition supports fluoridation. Please consider science rather than endorsements.

The US Food and Drug Administration and the Washington State Board of Pharmacy, all Pharmacopeias and most developed countries have determined fluoride when marketed for ingestion with the intent to prevent dental caries is a legend (prescription) drug.

The research is clearly showing too many (70%) of children have dental fluorosis, a biomarker of excess fluoride exposure.

The research is clearly showing mothers on fluoridated water and infants ingesting fluoridated water used to make their formula result in developmental neurotoxicity (lower IQ). In the last 4 years, 22 human studies report lower IQ. Grandjean et al 2021 reported 5 IQ loss with mother's urinary fluoride concentration at 0.7 ppm. Urine fluoride concentration mirrors the fluoride concentration of water the mothers and infants are ingesting and a Benchmark Dose for only 1 IQ loss is 0.2 ppm.

HB 1684 is built on historic tradition without looking at the current science. Dental caries are not highly contagious or lethal like COVID and fluoride ingestion should not be mandated when so many are showing signs of excess fluoride. Makes no sense to give those with too much fluoride even more.

Fluoride is now considered as lethal to the developing brain as lead. Although HB 1684 does not mandate fluoridation, it pressures more water purveyors to fluoridate their water.

Proponents have never answered the most fundamental question of how the fluoride gets from the blood in the tooth to the surface of the tooth where caries start or have started. No known mechanism for fluoride transfer through the tooth is known. Researchers are now reporting swallowing fluoride has little chance of reducing dental caries. No metabolic function requires fluoride. Fluoride is not a nutrient.

Proponents rely on endorsements, tradition and one side of the science. Please review the attached for more evidence. The Board has a great deal of historical evidence from previous submissions.

Please advise the Legislature to not pass HB 1684 until a more thorough and careful review of the science can be achieved.

Sincerely,

Bill Osmunson DDS MPH

Comments Regarding HB 1684 and Water Fluoridation

Bill Osmunson DDS MPH
American Environmental Health Studies Project, Board Chair
billosmunson@gmail.com

HB 1684 is a public health danger and very expensive.

Comments are presented below in summary form, followed by a more detailed review of some serious errors with HB 1684. Finally, the need for notifications to water users regarding the potential for fluoride overexposure and risks is presented.

Summary: See also [Fifty](#) reasons HB 1684 will harm the public

The lack of individual freedom of choice, excess exposure, serious risks and lack of FDA approval make HB 1684 harmful to public health. Hundreds of published research studies reporting fluoride's danger have been published since the 2006 [NRC report](#) for the EPA on fluoride in water. The 12 members were unanimous the Maximum Contaminant Level Goal as set by the EPA is not protective.

Yes indeed, the EPA classifies fluoride as a **contaminant** and HB1684 pushes water purveyors to contaminate their water. The legislature should not promote the contamination of water. The risks raised in 2006 included risks to [teeth](#),¹ [musculoskeletal](#), [reproductive](#), [neurotoxic](#) and neurobehavioral, [endocrine](#), [GI](#), [renal](#), [hepatic](#), [immune](#), [genotoxicity](#), and [carcinogenicity](#). Those links are for about 10,000 published studies reporting harm from fluoride. Each one of those links provide ample evidence to stop fluoridation rather than further overdosing the public.

Of urgent concern is fluoride's effect on the developing brain. Below are listed 22 human studies published from 2017 through 2021. Fluoride is presumed to be a developmental neurotoxin, more toxic than lead, lowering IQ. Lower IQ is known to increase special education in schools and drop outs, increase incarceration rates, increase crime, increase divorce and increase job loss. HB 1684 increases human suffering and significant monetary costs to society.

Grandjean et al,² 2021 "[A Benchmark Dose Analysis for Maternal Pregnancy Urine-Fluoride and IQ in Children](#)" reporting 1 IQ loss at 0.2 mg/L mothers urine fluoride concentration must be carefully reviewed by the legislature and Washington Board and Department of Health. Note, urine fluoride and water fluoride concentrations are similar. At fluoridation concentrations of 0.7 ppm (same as mg/L), 5 IQ points are lost. The highly respected international authors have more than a thousand published studies, many in the area of toxins on the developing brain. Their expertise has been accepted by research publications, courts and universities.

¹ All 12 members of the NRC committee agreed the MCLG should prevent dental fluorosis. See page 23

² Phillippe Grandjean is Professor at the T.H Chan Harvard School of Public Health and University of Southern Denmark. Howard Hu and Morteza Bashash are at the Department of Preventive Medicine, Keck School of Medicine USC. Christine Till and Rivka Green and David Flora, Faculty of Health, York University, Martha Tellez-Rojo, Mexico, Peter Song Department of Biostatistics, School of Public Health, University of Michigan, Bruce Lanphear Faculty of Health Sciences, Simon Fraser University, British Columbia,, Esben Budtz-Jorgensen Department of Biostatistics, University of Copenhagen, Denmark.

A careful scientific review inclusive of all stakeholders (including vulnerable members of the public) rather than blind trust in historic flawed policies and laws, needs to be a top priority.

HB 1684 is NOT supported by a careful review of current science. Topical fluoride has benefit, swallowing does not. Studies supporting fluoridation are mostly historic and have serious flaws. Water fluoridation as promoted by HB 1684 will cause harm in many ways, which constitutes negligence³ on the part of those promoting this bill, advocating for it, and voting for it. Some harms are outlined below in the remainder of the summary, and are described in further detail with citations following the summary.

HB 1684 will most seriously harm the unborn, infants, and children, and fails to warn pregnant mothers and caregivers of known risks. Fluoridation has similar if not greater risk to the brain than lead.

HB 1684 is built on historical policies and assumptions, marketing and trust rather than current science. Many studies have been published and more than 50 streams of evidence must be considered which have significant impact on HB 1684. A careful review of the science takes a great deal of time.

HB 1684 will harm the developing brain and teeth and will increase the burden to schools, businesses, parents, and society while having no FDA approved health benefit.

HB 1684 fails to provide individual recommended fluoride dosages for benefits and risks. Although water systems regulate the concentration of fluoride in water, they do not regulate the amount of water each person drinks. Therefore, individual dosage is unregulated and of most concern to the unborn and infants.

HB 1684 fails to notify water purveyors that the Washington State Board of Pharmacy determined that the ingestion of fluoride with intent to prevent dental caries makes fluoride a **prescription drug**. The US Food and Drug Administration has determined that fluoride for ingestion is an **unapproved drug** and the evidence for its efficacy is incomplete. Pharmacopeias list fluoride as a drug. If not regulated as a drug, fluoride fits within the definition of poison per RCW 69.38.010 (i.e., a substance that, when introduced into the human body in quantities of sixty grains or less, causes violent sickness or death). Note: 60 grains is 3,888 mg, and fluoride can cause death at 5 mg/kg body weight, or around 250-500 mg for an adult, less for a child. Fluoride is a poison under this RCW definition, however, it is exempt from poison laws in Washington State when regulated as an approved legend drug or exempted by law.⁴ Fluoride is not FDA approved, has no approved label, and no NDA number.

The World Health Organization's Technical Report Series 846, *"Dental and Public Health administrators should be aware of the total fluoride exposure in the population before introducing any additional fluoride program for caries prevention."* Many in Washington State are ingesting too much fluoride even without fluoridated water.

WHO's 1992 recommendation, *"Estimation of the amount of fluoride ingested from all environmental and dietary sources is important so that rational and scientifically sound decisions can be made when guidelines for the use of fluorides are reviewed periodically and modified."*

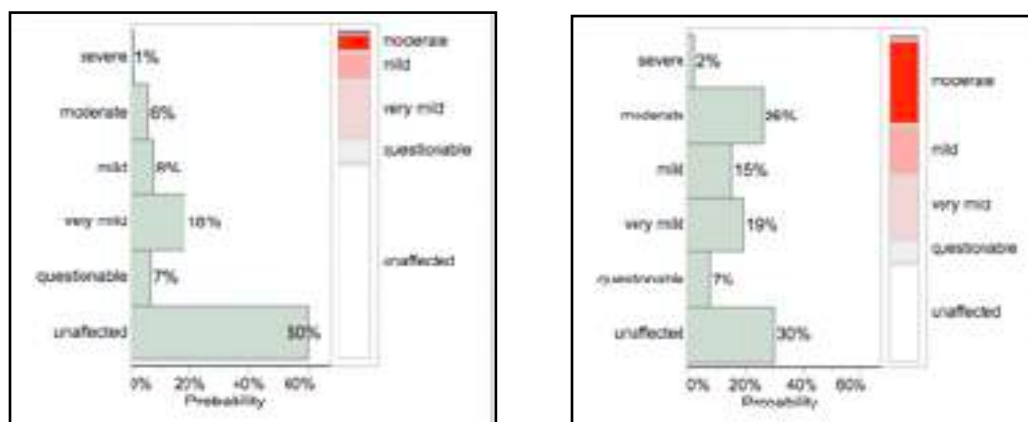

³ Negligence is defined as the failure to use the degree of care appropriate to the circumstances, resulting in an unintended injury to another.

⁴ A legend drug is a drug approved by the U.S. Food and Drug Administration that can be dispensed to the public only with a prescription from a medical doctor or other licensed practitioner.

During public testimony 1/25/2021, the Local Government Committee chairman mentioned that the legislature has asked the DOH (I believe it should be WSBOH) to advise on the safety and efficacy of fluoridation within the next 10 days. With many serious streams of evidence needing to be considered, and Federal reviews of just one of those streams of evidence has taken decades, the WSBOH will not be able to provide a complete literature review and reasoned studied advice. A cut and paste of historical policy and unscientific marketing opinions is inadequate and will result in harm to the public. As stated earlier, an unscientific review would constitute willful negligence on the part of the legislators promoting this bill and those voting for it.

Fluoride's mechanism of action is topical, not via ingestion. Fluoride works by interacting topically after teeth erupt. The evidence for its effectiveness when applied to erupted teeth is well supported. Fluoride incorporation into developing teeth is very minor and does not contribute to caries prevention. Fluoride is not a nutrient nor essential for any bodily function. A very small amount of ingested fluoride makes its way to saliva to provide some topical fluoride after tooth eruption, but this amount is 50 to 100 fold less than what is obtained from fluoride that is present in food and beverages. Enamel and dentin demonstrate significant transport hindrance. The effective pore radii of the transport pathways in the enamel are approximately 0.7-0.9 nm.

Many are ingesting too much fluoride and are overexposed. The two charts below, [Neurath et al, \(2019\)](#) compare dental fluorosis rates as reported by the National Health and Nutrition Survey, in the 1999-2004 and 2011 to 2012 survey periods. Moderate and severe dental fluorosis has significantly increased in the roughly 10 years between these two surveys.

[Dong et al \(2021\)](#) looked at the NHANES 2015-2016 and reported 70% of children and adolescents in the survey have dental fluorosis. [\(NIDCR\) Oral Health in America](#) is a sobering admission Oral Health in the United States needs to improve but even more fluoride is not the answer.

HB 1684 puts more emphasis and money on a failed public health policy rather than taking a fresh look at alternatives to better address oral health. Using a toxic chemical, a legend drug with an uncontrolled dose, to try to prevent dental caries, not only fails because it can't prevent caries but the policy is flawed because the policy fails to help those children develop good oral health habits which prevent other diseases such as periodontal disease, oral cancer, and good overall health.

Studies typically cited to support water fluoridation are of low quality, need to be carefully evaluated and understood, and need to be considered with all of the more recent streams of evidence.

Studies concluding fluoridation is effective, have problems, which include but are not limited to: not one study corrects for unknown confounding factors which is most important, not one prospective randomized controlled trial (RCT),⁵ socioeconomic status usually not controlled, inadequate size, difficulty in diagnosing decay, delay in tooth eruption not controlled, diet (Vitamin D, calcium, strontium, sugar, fresh and frozen year round vegetables and fruit consumption) not controlled, total exposure of fluoride not determined, oral hygiene not determined, not evaluating life time benefit, estimating or assuming subject actually drinks the water, dental treatment expenses not considered, mother's fluoride exposure not measured, breast feeding and infant formula excluded, fraud, gross errors, and bias not corrected, and genetics not considered. The FDA is correct, the evidence for efficacy is incomplete.

Note the "Fluoride Rich Zone" figure to the right. When the tooth is sectioned like slices of bread and the fluoride concentration measured in each slice, the fluoride concentration in each slice is similar regardless of fluoride intake except on the outside layer from topical fluoride. Fluoride does not migrate through the tooth as we were taught in dental school.

No agency accepts jurisdiction for determine the safety, dosage, label and benefit of fluoridation. In a letter from the Washington State Department of Health (WSDH) I was informed the WSDH *"will rely on known national entities like the CDC and EPA to assess the science"* on fluoridation.

The Washington State Legislature relies on the WSDH who rely on agencies not responsible for determining the safety, efficacy, dosage and label of the fluoride drug. Neither the CDC nor the EPA⁶ are charged by Congress to regulate the addition of fluoride in water with the intent to prevent disease. The EPA is prohibited from adding anything to water for the treatment of humans, EPA treats water. EPA relies on the FDA. The FDA does not regulate public water systems. When the CDC warned care givers to avoid using fluoridated water to make infant formula, the WSDH disagreed and protected policy rather than infants.

Jurisdiction of fluoride is like a hot potato tossed to "someone else" and no one has jurisdiction. HB1684 should be amended to designate an agency(s) to have jurisdiction. Congress has charged the FDA with jurisdiction and the Washington legislature should do the same. Once fluoride is FDA approved, the dispensing of fluoride in water needs to have WSDH jurisdiction.

⁵ A prospective study is an epidemiologic study in which the groups of individuals (cohorts) are selected on the bases of factors that are to be examined for possible effects on some outcome. For example, the effect of exposure to a specific risk factor on the eventual development of a particular disease can be studied. The cohorts are then followed over a period of time to determine the incidence rates of the outcomes being studied as they relate to the original factors in question. Also called a cohort study. Examples include concurrent cohort studies and randomized controlled trials.

⁶ Safe Drinking Water Act Section 1412 (b)(II)

I. REVIEW of HB 1684 Flaws

Sec. 1 (1) claims fluoride is a proven mechanism for reducing health disparities affecting people of all stages of life.

Consistent and undisputed evidence demonstrates there are disparities in health and oral health. However, fluoridation has not and does not close those disparities (e.g., see [\(NIDCR\) Oral Health in America](#)). The science is robust, HB1684 will make disparities worse by causing harm to many.

A Cochrane analysis (2015) of fluoridation research lacked a single RCT, reported studies to be mostly historic, mostly of naturally occurring fluoride with high mineral content, before much toothpaste was used, no life-time benefit, no benefit for social disparities, but studies available did find relative benefit from tooth decay. We will show how those studies of benefit have serious flaws.

Studies reporting increases in dental caries in low socioeconomic cohorts are low quality with many flaws (see [Neurath et al \(2017\)](#))

Sec 1 (2) “The legislature further finds . . . fluoridated water promotes community oral health. . . ”

Fluoridation does not promote health or reduce disparities. The graph below is from data of the National Survey of Children’s Health, US HHS, 2005. Note the 50 states of the USA and reported “good to excellent teeth.” About 80% of the wealthy have good teeth and about 52% of the poor report “good to excellent teeth.” However, fluoridation has no common cause. Oral health and health equities would be better with fluoridation money spent on improving income and health education rather than imposing a highly toxic chemical with serious side effects.

Sec 1(3) “The legislature further finds . . . bridge social inequities” See comments on Sec. 1(1). No quality research demonstrates fluoridation bridges social inequities.

Sec 1(5) “The legislature further finds . . . fluoridation is cost-effective. . . ” The legislature relies on assumption of benefit and estimates the cost savings based on that flawed assumption.

[Ko \(2015\)](#) estimates a savings of “\$3 per person per year for best-case scenario, but this savings is eliminated by the estimated cost of treating dental fluorosis.”

[Maupome \(2007\)](#) compared cost of dental treatment for children in health maintenance organization (HMO) members in fluoridated Vancouver, WA ((\$186/year) with unfluoridated in Portland, OR (\$180/year) and found enough savings to pay for equipment repairs, but not for the costs of installing the equipment, introducing the chemicals, or the costs of treating dental fluorosis. About 2% difference is within the differences in diagnosis and treatment skills of the dentists.

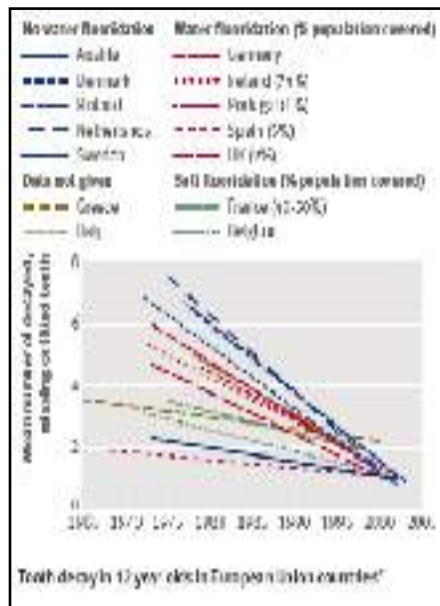

Estimates usually do NOT include the cost of: 1) other chemicals added (e.g., pH balancing chemicals to reduce damage to water system infrastructure) because hydrofluorosilicic acid (HFSA) is used, 2) fluoride testing, 3) record keeping and reporting, 4) extra hazmat precautions and training, 5) fluoride equipment maintenance, upgrades & replacement, 6) fluoridation promotion such as HB 1684, 7) added liability insurance and legal fees, 8) holding fluoridation plebiscites, 9) HFSA spills and fluoridation overfeeds, 10) avoiding fluoride in families sensitive to fluoride, 11) treating objectionable fluorosis, or 12) treating other fluoride-related health problems.

Frequently proponents suggest they are only adjusting the natural fluoride concentration in the water. If the natural concentration of arsenic, lead, or other toxins were “adjusted” higher, we would also object. “Natural” fluoride is generally found in the form of calcium fluoride, a less toxic form of fluoride than the industrial waste product HFSA. In addition, the bioavailability of added fluoride chemicals like HFSA varies depending on the hardness of the receiving water. Washington State for the most part has relatively soft water, and thus the bioavailability and potential intake of fluoride into body tissues is greater than locations where the water is harder. Generic policies regarding target concentrations of fluoride fail to account for these types of important factors determining exposure.

Sec 1 (6) “The legislature further finds. . . fluoridation. . . is essential”

Fluoride is not an essential nutrient. Dental caries are not due to inadequate fluoride ingestion. For example, scurvy is the result of inadequate vitamin C, dental caries are not the result of inadequate fluoride ingestion. British Columbia has lower dental caries rates without fluoridation than Washington State. Oregon with about 19% fluoridated has slightly lower caries than Washington with about 44% of the population fluoridated. Some areas of Europe have lower caries rates and no fluoridation. Fluoride is not an essential mineral for the body, it is a toxin.

Two studies published using WHO data graphically demonstrate dental caries decline regardless of fluoridation. Fluoridation is not essential for good oral health.

Chen et al, BMJ 5 October

Neurath: Fluoride Research 2006

Colquhoun 1997 ISFR published the following graph illustrating the decline of dental caries prior to fluoridation. No studies on fluoridation address the factors causing a dramatic reduction in dental caries prior to fluoridation. As can be seen above, other countries continued the decline regardless of fluoridation status. The FDA is correct when finding the evidence for benefit from fluoride ingestion is incomplete.⁷ The recent PPTOX keynote speaker, former director of the US NTP and OHAT confirmed ingested fluoride would not reduce dental caries.⁸

⁷Published in Drug Digest 1975

⁸ Prenatal Programming Toxicity Conference, January 2022, Del Linda Birnbaum retired from National Toxicology Program and Office of Health Assessment and Translation 771717

In contrast, the CDC presents Figure 1 of support for fluoridation. At first glance it appears an increase in fluoridation reduces dental caries. However, the CDC cherry picked the years. Indeed, caries declined and percentage of the population fluoridated increased but the two events are unrelated. Caries rates were declining regardless of fluoridation. And consider perhaps more of the public were randomly fluoridated in cities and CDC would have us believe that resulted in an implausible 70% decline in dental caries. The fluoride was not targeted to high risk individuals.

The legislature has failed to provide current scientific support for the marketing claim that fluoridation is essential. Most dental caries decline took place prior to fluoridation. No one knows what factors were most significant in causing the decline, and no studies have corrected for those highly significant unknown factors.

Consider these countries response to fluoridation:

Austria	REJECTED: "toxic fluorides" NOT added
Belgium	REJECTED: encourages self-determination – those who want fluoride should get it themselves.
Finland	STOPPED: "...do not favor or recommend fluoridation of drinking water. There are better ways of providing the fluoride our teeth need." A recent study of Finnish data found "...no indication of an increasing trend ...of caries."
Germany	STOPPED: A recent study of German data found no evidence of an increasing trend of caries.
Denmark	REJECTED: "...toxic fluorides have never been added to the public water supplies in Denmark."
Norway	REJECTED: "...drinking water should not be fluoridated"
Sweden	BANNED: "not allowed". No safety data available!
Netherlands	REJECTED: "...at present the addition of chemicals to drinking water is prohibited by law in the Netherlands. This law came into effect because it was widely perceived that drinking water should not be used as a vehicle for pharmaceuticals. Furthermore, fluoridation of drinking water would conflict with the freedom to choose for natural drinking water. This principle of freedom of choice is considered as an important basic principle in the

Netherlands.” [SOURCE](#): 2007 – RIVM report 270091004/2007 for the Dutch Ministry of Health, Welfare and Sports.

Hungary STOPPED: for technical reasons in the '60s. However, despite technological advances, remains unfluoridated.

Japan REJECTED: "...may cause health problems...." The 0.8 -1.5 mg regulated level is for calcium-fluoride, not the hazardous waste by-product which is added with artificial fluoridation.

Israel SUSPENDED mandatory fluoridation until the issue is reexamined from all aspects.: June 21, 2006 “The labor, welfare and health Knesset committee”

China BANNED: "not allowed“ China sells their fluoride toxic waste to the USA for us to drink in fluoridated water.

France REDUCED: Was 50% purchased fluoridated salt, decreasing to 30%.

US organizations opposed to fluoridation include the International Academy of Oral Medicine and Toxicology, International Academy of Biological Dentistry and Medicine, and the American Academy of Integrative Medicine.

Numerous USA organizations support fluoridation, but those are endorsements, not science, and those organizations do not accept jurisdiction or liability for fluoridation.

Some studies show increased dental caries with increased fluoride exposure. Note the graph below from Iida and Kumar (2009). With increased fluoride concentration, dental fluorosis increases and dental caries (red line) has very slight decrease between 0.3 and 1.2 mg/L and then caries increases with increased fluoride exposure at concentrations >1.2 mg/L.

The American Dental Association provides this picture of Early Childhood Caries in its promotion of water fluoridation.

Fluoridation did not help that child. Are proponents of fluoridation suggesting that fluoridation only helps bottom teeth? No. This child has baby bottle caries, going to bed with a bottle of juice and sucking on it while sleeping. The tongue protected the bottom teeth to some extent but not the top. The damage is tragic, and health education would help, not fluoridation. Forcing water fluoridation of 100% of Washington State or the world will not help children like this, but health education can.

Fluoridated toothpaste is FDA approved. Note that the label states, "Drug Facts" because fluoride is a drug when marketed with the intent to prevent dental caries and is a drug because it is listed in the Pharmacopeias. The warnings on the label are especially intended to protect infants and children. The picture below shows a large pea size of toothpaste, which contains twice as much fluoride (about 0.5 mg) than the amount of fluoride recommended by the FDA in drinking water (about 0.25 mg per large glass of water). In other words, each large glass of fluoridated water contains about a quarter milligram of fluoride, which in the form of toothpaste, the FDA warns not to swallow.

FDA 1975 warned manufacturers of fluoridated supplements the evidence for efficacy was incomplete and maintains that position today.⁹ The FDA sent a warning to the company DS Waters of America that their fluoridated Nursery Water product is misbranded and illegal to be sold for children under the age of two. Fluoride ingestion has never gone through the FDA approval process, and fluoride is determined by both the FDA 21 USC 321 (g)(1)(B) and Washington State Board of Pharmacy to be a legend drug.

In 2013, Steve Neugeboren, Associate General Counsel of the EPA's Water Law Office [responded](#) to the question of who had jurisdiction over the fluoride added to water supplies as follows: *"The FDA, remains responsible for regulating the addition of drugs to the water supply for health care purposes."*

In 2001, the FDA testified fluoride is a drug. In 2012 FDA Donald Dobbs Consumer Safety Officer Division of Drug Information responded, *"... FDA has no authority to regulate fluoride compounds used to fluoridate public drinking water. . . is regulated by the US EPA"* SDWA.

EPA and FDA each assign jurisdiction for regulating chemicals used in water fluoridation to the other agency, and thus neither are taking responsibility for determining the safety and/or efficacy of the practice.

The EPA testified to Congress in 2001, "The EPA has no "empirical scientific data on the effects of fluosilicic acid or sodium silicofluoride on health and behavior."

The FDA warned manufacturers of fluoride supplements, *"...there is no substantial evidence of drug effectiveness as prescribed, recommended or suggested in its labeling. . . marketing is in violation of the new drug provisions of the Federal Food, Drug, and Cosmetic Act; they have, therefore, requested that marketing of these products be discontinued."* FDA Letter to 35 Companies (DRUG THERAPY 1975).

EPA scientists have expressed their concern through their union, *"In summary, **we hold that fluoridation is an unreasonable risk.** That is, the toxicity of fluoride is so great and the purported benefits associated with it are so small - if there are any at all – **that requiring every man, woman and child in America to ingest it borders on criminal behavior on the part of governments.**" Dr. J. William Hirzy, Senior Vice-President, Headquarters Union, US Environmental Protection Agency, March 26, 2001.*

Sec. 2 of HB 1684 attempts to pressure water purveyors to fluoridate their water and fails to explain the other sources of fluoride available to people, such as tea, toothpaste, and supplements. Giving people freedom of choice for treatment of a non-lethal and non-contagious disease (dental caries) is the ethical approach. Forced treatment without informed consent is not ethical.

The fluoride chemicals added to water are not pharmaceutical grade but have contaminants. Currently, a shortage of fluoride chemicals in the USA is forcing some suppliers to purchase fluoride from other countries (including China) and the contaminants in these sources are not monitored or known.

Sec. 4. HB 1684 appears to make discontinuing fluoridation difficult, in effect strong arming water systems with the assumption that the legislature knows best, and the assumption that fluoride ingestion has benefit

⁹ Drug Digest 1975

without risk. Science is dynamic and our understanding evolves. One size or dosage does not fit everyone. Variations in ages, genders, and the existence of other health problems make mass medication using an unapproved drug dangerous and illegal.

Sec. 5. HB 1684 calls for implementing assessments, but the assumption built into the bill is that fluoridation will reduce inequities. Connecticut, Detroit and Boston have fluoridated for over 60 years and report a crisis of dental caries. Kentucky (2003), fluoridated for 50 years, was awarded 100% fluoridated by the American Dental Association and yet ranked as the #1 highest state in number of edentulous residents (individuals without teeth). Fluoridation has not helped Kentucky. Giving a highly toxic substance to everyone without consent is not ethical or effective.

II. HB 1684 MUST INCLUDE A PROVISION FOR NOTIFICATION OF WATER USERS REGARDING THE RISKS AND POTENTIAL FOR OVEREXPOSURE TO FLUORIDE.

1. **Dental fluorosis** is an undisputed and known risk of fluoridation and brushed off by some as only cosmetic. Cosmetic harm is harm for some people. Damage to a person's face resulting in a scar is both harm and cosmetic. Dental fluorosis is a biomarker of excess fluoride exposure, and thus an indicator of potential harm to other tissues in the body. Fluoride promoters' assumption that the only risk of fluoride is to teeth, and the presumption that it is safe for all the other cells and functions of the body is seriously flawed. I sometimes treat dental fluorosis. Lifetime treatment for teeth damaged by fluorosis can cost over \$100,000 per person.

Below is an electron microscope look at dental fluorosis.

Below is an example of a “Fluoride Bomb.” Fluoride makes the tooth harder and more difficult to diagnose the caries, resulting in a bombed-out tooth when the caries are finally diagnosed.

Below are photographs taken before and after treatment of dental fluorosis, at a cost about \$1,000 per tooth, with an average treatment lifespan of 15 years (i.e., requiring future re-treatment). (Photo Courtesy of Dr. Markus)

Caregivers should be notified and clearly instructed not to give fluoridated water or fluoride supplements to their children, and to teach their children to spit out toothpaste before swallowing.

A 2009 review paper covering 17 studies found that *“Infant formula consumption was associated with a higher prevalence of enamel fluorosis in the permanent dentition”* Hujoel et al, JADA:2009,140:849.

The [CDC](#) states that *“Dental fluorosis only occurs when younger children consume too much fluoride, . . . when teeth are developing under the gums.”* And this is the same time during which fluoride is the most dangerous to the developing brain.

2. Development neurotoxicity from fluoride is a serious risk.

At a minimum, HB 1684 needs to require that water purveyors providing warnings regarding the adverse effects of excess fluoride exposure and the risks to vulnerable subpopulations.

For over four years the National Toxicology Program has been reviewing fluoride’s effect on the developing brain, developmental neurotoxicity. A [draft review](#) is available and is reported to be finalized later this Spring. However, the draft report does not include the most recent studies. In just a few months, the research has become more exact and specific reporting harm with ever lower fluoride concentrations.

Here are links to:

[23 human studies](#) published since 2017 on the association of fluoride exposure and reduced IQ.

[125 human studies](#) published on cognitive function and IQ score.

In 2021, Grandjean et al published [“A Benchmark Dose Analysis for Maternal Pregnancy Urine-Fluoride and IQ in Children”](#). This is the second fluoride benchmark study published that finds fluoride causing lower IQ and using measured data of urine-fluoride concentrations. The authors conclude, *“Thus, the joint data show a BMCL in terms of the adjusted U-F concentrations in the pregnant women of approximately 0.2 mg/L. These results can be used to guide decisions on preventing excess fluoride exposure in pregnant women.”*

Note that urine fluoride concentrations are similar to water fluoride concentrations, which make the measures used in these modern studies particularly valuable. Based on this study and others, water fluoridation at 0.2 ppm (mg/L) would cause loss of 1 IQ point. Fluoridation target concentration is at 0.7 ppm, and is reported to cause a loss of 5 IQ points. See Fig 1 below from Grandjean et al (2021).

Note Fig 1 below from Grandjean shows about a 5 IQ point loss with urinary (and water) fluoride concentration of 0.7 ppm.

Mothers consuming fluoridated water are lowering their child's IQ. Scientists are starting to evaluate the effect of toxins on sperm development, where it appears that fluoride may lower sperm count, and the effects may be carried on for 2 to 4 generations. ([2022 PPTOX Conference](#)).

HB 1684 must require water purveyors that fluoridate to warn mothers to not drink fluoridated water and caregivers to not use fluoridated water for making infant formula.

The significance of 5 IQ point loss is illustrated in the two bell curves below. The low IQ have a disproportionate harmful effect. Our special education classes have a 57% increase. The number of gifted have a 60% reduction. How can we tell if an average child should have been gifted. "Frying" our children's brains has a serious impact on all of us.

In 2006, the EPA was advised by the National Research Council to do a Dose Response Analysis and Relative Source Contribution Analysis. Their report was published in 2010, and it showed that at least a third of children under seven years of age would exceed what was then considered as a safe dose of fluoride.

EPA's Figure 8-1 (reproduced below) graphically illustrates those most at risk. Note that infants are not included, even though these are an even greater at risk population. The percentage above the black line are ingesting above "safe" dosage levels. The black line is demonstrating redefining the "safe" daily dosage up by 33%, but even with that change, children will still not be protected. In addition, this figure only addresses water intake for 90% of the public, and does not address the 10% drinking the most water and infants are ignored.

The graph below ranks the 50 USA states and the reported “mental retardation” in 6 to 17 year olds per 10,000 population of their state. Although there are many factors affecting what is reported as “mental retardation,” fluoride does appear to have a common cause.

In 2016, the EPA was taken to court to defend a claim that their Maximum Contaminant Level for fluoride is not safe and allows for lowering of IQ to occur. The case is under the Toxic Substances Control Act in the Federal Court in San Francisco (Case Number: Civ. No. 17-CV-02162-EMC). EPA hired experts because the EPA claimed they don't have anyone capable of determining the toxicity of fluoride. The EPA is not capable of protecting the public from the risks of fluoride. The judge has scheduled the next hearing in the case for June 7, 2022.

Although the focus of fluoride researchers in the last few years has been on developmental neurotoxicity, other health risks from excess fluoride exposure to teeth, musculoskeletal, reproductive, neurotoxic and neurobehavioral, endocrine, GI, renal, hepatic, immune, genotoxic, and carcinogenicity must

also be reviewed. Consider a search on www.pubmed.gov for terms such as “fluoride cancer” “fluoride thyroid” and “fluoride _____” filling in the blank with each of the risks as listed by the NRC 2006 review of fluoridation for the EPA.

Thank you for your careful consideration of HB 1684’s serious flaws and vote NO.

External Email

Dear Ms. Donahoe,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

When is the next tag meeting ? Consideration of requirement for the Covid vaccine for kids have you guys talked to doctors about the side effects of the vaccine on kids and the long lasting effects it could have on their heart? Also has the board talked to doctors about immunity with kids and the kids that have already had Covid and kids that cannot receive the vaccine ? Has the board also taken into consideration that phase 3 testing of the childhood Covid vaccine testing will not be completed until May 20 26 I believe a lot of parents are reluctant to give the vaccine to their children for that exact reason .

To the BOH:

I strongly oppose the inclusion of the potentially gene-altering Covid shots , commonly referred to as vaccines , as part of the requirement for school enrollment.

The COVID-19 experimental biological products are touted as safe and effective, yet the FDA and Pfizer are currently fighting in court (again) to delay releasing the safety data. What is there to hide? Where is the transparency? Why can't independent scientists review the safety data?

Reproductive toxicity has not been properly evaluated. There have been NO studies for genotoxicity and NO studies for carcinogenicity. Animal studies are incomplete and inadequate.

Once these shots are included as a part of the required vaccines for entering school the drug manufacturers & government cannot be held liable for any adverse reactions , either acute or chronic . So why the rush to vaccinate considering these shots have not gone through adequate testing and for which the safety data has not yet been released ?!

Children who become infected with SARS co-v2 typically experience mild cold or flu-like symptoms. Such a presentation of mild symptoms hardly warrants the forcing of an experimental vaccination ! And children have not been proven to be super spreaders of Covid.

And since the vaccines were designed for the original strain of this virus ; and since the virus keeps mutating as we've witnessed with this newest variant - Omicron ; and since these old vaccines have not proven very efficacious against the Omicron ,as we've seen in the large numbers of fully vaccinated people contracting Omicron, it seems like a waste of time , effort ,and potentially a risk , as the shots could do damage to the current good health status of each child, in an to attempt to vaccinate against today's or tomorrow's variant using an obsolete vaccine that was designed for yesterday's strain.

Thank you ,
Brenda L Oster , active-retired RN

External Email

Hello,

I am strongly opposed to mandating the Covid vaccine for children in order to attend school. This vaccine is unnecessary in children unless they are at high risk with immune compromising issues. The science has shown all along that children are not dying of Covid and IF they get it, symptoms are much like the flu.

We need to stop this overreach and leave it up to the parents to decide.

NO VACCINE MANDATE FOR KIDS!!!!

Regarding your Criteria #5:

The mRNA vaccines available currently do not work. You can see that in countries where the vaccination rate is the highest, such as in Australia, the rate of infection is way up, as well as deaths. <https://graphics.reuters.com/world-coronavirus-tracker-and-maps/countries-and-territories/australia/>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fgraphics.reuters.com%2Fworld-coronavirus-tracker-and-maps%2Fcountries-and-territories%2Faustralia%2F&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C9d87bfd9f90b4aa7419708d9e>>

Israel is giving up, realizing that the vaccines do not work, placed an order for a vaccine called Novavax which is using old-fashioned protein technology.

Also, mRNA vaccines do nothing at all to stop spread of the virus, therefore it is completely pointless to vaccinate children, since the risk of adverse effects outweighs the danger of covid.

You could revisit this issue once the Novavax is approved in the US.

COVID testing company faked test results, lied to patients, WA lawsuit says

Jan. 31, 2022 at 3:55 pm Updated Feb. 1, 2022 at 7:18 am

https://www.seattletimes.com/seattle-news/health/covid-testing-company-faked-test-results-lied-to-patients-wa-ag-lawsuit-says/?utm_source=twitter&utm_medium=social&utm_campaign=article_inset_1.1

An Illinois-based coronavirus testing company with at least 13 sites in Washington, faked or delayed test results (or provided none at all), lied to patients and failed to properly store test samples, according to a lawsuit filed Monday by Washington state Attorney General Bob Ferguson.

The lawsuit, filed in King County Superior Court, describes how the company, Center for COVID Control, expanded to about 300 U.S. locations and allegedly took advantage of residents at a time when frequent testing was in high demand as a "critical tool in the fight against COVID-19."

"Center for COVID Control contributed to the spread of COVID-19 when it provided false negative results," Ferguson said in a statement. "These sham testing centers threatened the health and safety of our communities. They must be held accountable."

The suit also alleges the Center for COVID Control stored tests in garbage bags for more than a week, rather than properly refrigerating them; backdated sample-collection dates so stale samples would still be processed; and instructed its employees to "lie to patients on a daily basis" when Washingtonians asked about delayed results.

Ferguson also named Akbar Syed, Aleya Siyaj and Doctors Clinical Laboratory in the lawsuit.

Hello,

I am writing to comment on the recommendation of the Covid vaccine for attending public school in Washington. In the current situation, there is not enough data to support this vaccine being beneficial to kids staying in school. Unless we tested the entire population randomly, we would have no idea what the infection rates of Covid actually are. All of the data in King County is gathered through people actually driving to testing sites or choosing to report a rapid test, hardly a good measure of how many cases are in the community. Even my high schoolers know this, due to their excellent education.

Please don't tell us that there will be exemptions, without explaining what rules will apply to students with exemptions. This issue should be addressed now and not later.

By the time fall rolls around, this vaccine will be almost 2 years old and probably even less effective at stopping Covid than it is now.

I don't want to move my students out of our public schools here, but I will do so. They are excellent students and I will not have them missing school unless they are actually sick.

Thank you.

Carlin Flubacker

I am emailing you in reference to the voting that is taking place today on the Covid 19 mandate for children to enter schools.

I strongly oppose this mandate. I will be home schooling if this takes place in our state- which will pull me away from my full-time Clinical Practice.

The risk for children is low for Covid-19 but the risk they are taking with the vaccination runs high (we now know there is a high risk of myocarditis).

If teachers feel unsafe they should mask and vaccinate.

Please consider all facts before voting today.

Thank you for your time.

Hello Board Members,

I understand that you will be reviewing updates to the vaccination schedule and making a determination of the FDA emergency authorization Covid-19 shoots should be added per criteria 5 & 6. Based on my understanding of these two criteria, even if any of the shoots had been approved they still do not meet the requirements as follows:

- * Prevents disease: The CDC, FDA and WHO have all acknowledged that the Covid-19 shoots do not prevent the obtaining or spreading of the disease. It is only reducing symptoms and shortening the duration of the effects of the disease.
- * Disease morbidity and mortality: The CDC, FDA and WHO has all acknowledged that the morbidity and mortality rate from Covid-19 of school aged children without comorbidities is significantly low and is comparable to regular seasonal colds and flues.
- * Person-to-person transmission: Again, the CDC, FDA, & WHO have acknowledged that the Covid-19 shoot does not prevent this and that as the disease continues to mutate that the shoots are becoming even less effective at doing what little it did before.

At this time I hope you understand after reviewing all available information that is out there that adding the Covid-19 shoot to the list of required vaccinations is not justifiable at this time since it does not meet the criteria for 5 & 6, but also does not meet legal requirements and challenges that would arise if approved by the board. I request that adding the Covid-19 shoot to the list of required vaccinations is tabled, by voting no for its acceptance, until it meets the criteria for 5 & 6 and has been approved by FDA for use for all school aged children.

Thank you for your consideration of the above comments and your time for reading this and your service on the board.

Sincerely,

Bryan Lackey

Dear sir, we received an email from our school on February 1 regarding the survey for Covid vaccination if it were made a requirement for school entry . Apparently it closed the very next day on February 2(it may have reopened but the date of actual closure is unclear. As of today it is all closed Feb 6). Was it the state who gave us such a little timeframe to respond to the survey or was the school delayed in getting the survey to us? I'm wondering who I should contact regarding this. Thank you

External Email

Dear Ms. Lang,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

Subject: Washington Board of Health School Survey on Covid Requirement

External Email

To whom it may concern:

I wanted to respond to the Washington State Board Health Survey but it seems it is no longer available. This is a shame that you did not make clear the deadline or that you are preventing the community from voicing their opinions.

Requiring the covid vaccine for my children would be a burden on us financially. It would require my husband to take time off work or the funds for us to hire a babysitter and the cost of gas (which is increasing) so that we could transport our children to an additional appointment. It would also be a burden/traumatization for our children who don't like getting shots and who would then need three (two for the vaccine and a booster every six months).

Another concern we have about requiring this vaccine is the infringement on parental rights. I believe every parent should have the right to decide on medical treatment for their children. This vaccine has neither proven to be effective in stopping children from catching the virus or spreading it; that is very disappointing results. In addition there have been known adverse side effects in the test studies and it seems to be unethical to require such a vaccine.

Finally, requiring the vaccine would infringe on the right to education, without any real benefits (i.e. since the vaccine doesn't stop the spread or from catching it). How can you ethically bar children from attending school because they haven't received an ineffective vaccine? I am opposed to forcing an ineffective and potentially harmful vaccine at the expense of my children's education.

Sincerely,
Maria Plumb

I am writing because there is no proof that the vaccine is safe for children. In fact, there is proof that children who have been given the vaccine have died and have suffered from myocarditis and other heart inflammation issues. There is no published safety data for adults, never mind children. Personally, I took the vaccine and still got Covid, as did some of my friends. I have friends who were never vaccinated and never got Covid. Covid does not affect children severely, unless they have certain comorbidities. Why should we risk injecting our children with a vaccine that is approved for Emergency Use Only. This vaccine is not licensed for any human! We don't know how this will affect our children 20 years from now.

...to the list of required vaccines for students to attend school is a mistake.

1. There is no evidence of vaccine efficacy. The shots don't stop or slow the spread of infection and do not prevent infection.
2. The pharmaceutical companies do not have any liability for vaccine injuries and the vaccines have not been properly vetted.
3. There is no evidence supporting that benefits of the shots outweigh the risks of the shots.
4. Children do not appear to suffer major health problems as a result of getting or having had Covid.
5. This is a gross example of a government overreach. The people will not have it. Democrats and republicans are uniting on a new common ground: FREEDOM. There will be serious repercussions for the state as a whole....

Subject: Health survey for requiring COVID vaccine for students

External Email

Hello, I just found out about the Health survey for requiring COVID vaccine for students in the State of Washington

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fsboh.wa.gov%2FNews%2FArticles%2FSurveys-Now-Available-Parents-and-Caregivers-Provide-Feedback-to-the-TAG-Responses-Accepted-Until-Wed-Feb-2&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Cfb3c155901f145bc5c1508d9e6b9bb79%7C11d0e21726>>
and when I went to click on the links, it showed they were already closed.

It unfortunate there was such a low amount of responses that could be recorded and how little it was publicized to ensure it reached all parents. The schools send out vaccine clinic emails once a week but couldn't send one email asking for parents feedback for this forced mandate on a broad scale.

I strongly reject the idea of a vaccine mandate for school age children in the state of Washington. I live Bothell and my 7 year old attends the North Shore School District. With weekly testing the North Shore District has not had any major outbreaks. With weekly testing and proper remote school technology options in place, there is no need to risk kids life from having irreparable side effects.

I have been suffering from an adverse Pfizer vaccine reaction that has completely impacted my quality of life. I had no prior medical issues and now have daily neurological symptoms for which I am seeing 5 different doctors from neurologists, to immunologists, to holistic specialists for detox and 6 months later, I still have no relief after spending tens of thousands of dollars. I have reported it to VAERS, CDC and Pfizer and no one cares to help those injured from the vaccine.

I am not alone, there have been over 1MM adverse reactions reported to VAERs in the US alone. So many other countries are doing away with mandates and many colleges in the US have done so already.

If you enforce this mandate, you will thousands of parents pull the kids out from public schools which will greatly reduce you funding.

Please take this into have a proper survey via a proper survey tool to capture proper

feedback.

Thank you for your consideration.

Jennifer Lazo

To whom this concerns,

We have seen the enemy and it is the corrupted, bribed, coerced and complicit federal, state and city governments who have deliberately engaged in this planned-demic to create the greatest crime against humanity to date. You have destroyed our economy, social structure, abused our children who are essentially immune from this 99.9% survival rate flu. And then assaulting the population with a toxic life threatening inoculation which has permanently injured millions and outright killed hundreds of thousands, far exceeding any legitimate deaths from this flu, which has been gone for over a year now. The medical and scientific fraud is staggering, the cognizant dissonance and malice of Inslee's office and his very questionable relationship with the genocidal maniac and international despot Bill Gates is inexcusable. All the while using a fraudulent testing procedure(97% false positive and which tap water gives a positive result) to further cripple the population is beyond reprehensible. Any further ridiculous and draconian behavior from this body will not be tolerated. This fascist agenda Inslee is engaged in is an act of terrorism and treason and along with all your names , address and email, his information and crimes will be handed over to the Nuremberg court currently in session. I pray you do the right thing and rescind any further crimes against the people by supporting this fraud but i know you, like the despotic school board, are bribed and incentivized with billions of our tax dollars by this illegit Biden admin to assault the people and our children. You will be held responsible for your complicity and your complacency. Like DC, MSM, CDC, AMA, WHO, NHS, etc., this governing body has become the enemy thru your treasonous crimes against our republic and our constitution. There has never been a pandemic, no excess death and which effected less than one half of one percent of the population and for this you threaten concentration camps and police intrusion into our homes and businesses. Have you no morality or conscience?

This adventure has pointed out the incompetence and fraud which is the medical industry and how our despotic politician's prey on the people. Those who have awakened will never sleep again. I, for one, will never comply with this criminal enterprise, or my children and grand children. We have seen the enemy.

Sincerely,

Stephen Joseph Strickland

Pfizer's own trial data, are starting to be released in response to a Freedom of Information Act (FOIA) request to the FDA. Cumulatively, between Dec. 1, 2020, and Feb. 28, 2021 — a period of just 2.5 months — Pfizer received 42,086 injury reports, including 1,223 fatalities.

Why are life insurance companies reporting deaths are up 40% in 18-64 year olds? These are not COVID deaths.

These vaccines are not safe and nobody has any business telling a parent they have to vaccinate their children to be able to attend WA State schools.

To whom this may concern,

My name is Dr. Clifford Knopik.

I am writing pertaining to the consideration of COVID-19 vaccines being required for school age children in order to attend school.

I am opposed to this because after spending a year and a half submitting public records requests to the WA Department of Health and analyzing the data returned I have found the following:

1) The WA DOH has made serious data collection issues that have corrupted their entire data set. This has resulted in the inability to have any reliable, accurate data to base public policy on.

2) The data that counties are gathering are now showing most cases and deaths are in the vaccinated population. For example, in King County, as of 2/2/22 61% of all cases are fully vaccinated people and 52% of all deaths are fully vaccinated people.

The vaccines do not stop the spread of COVID-19 and do not adequately protect people from COVID-19. The state's COVID-19 data is a shambles and inadequate to create public policy from. There is no other authoritative data for COVID-19 in Washington State.

The Washington State Board of Health should not require broken vaccines to be mandated and they should not base decisions on faulty COVID data. This would be irresponsible to do towards children.

I would love to meet with the board to walk through a presentation of my findings of the data issues I have uncovered and talk about the implications.

Respectfully,

Dr. Clifford Knopik

Dr. Clifford Knopik has a Doctorate in Computer Science from Colorado Technical University. He also has a Masters in Information Systems from Penn State, a Masters in Homeland Security from Penn State, a Masters in Information Assurance from Dakota State University, a Bachelors in Social Studies from Washington State University, an Associate in Emergency Management from Clackamas Community College, and an Associate in Computer Programming from Pierce College. He was honored to serve for five years in the Washington State Guard where he received emergency management training through FEMA and the Washington Emergency Management Department.

Subject: School survey about vaccinating children from COVID-19

External Email

To whom it may concern,

I received a survey link from our local elementary school (Greywolf Elementary) to take a survey about whether or not children should be vaccinated against COVID, but the link did not work for me so I figured I would just send an email.

My wife and I believe vaccination against COVID 19 should be up to the parents, not the state, not the schools. We will not vaccinate our children from COVID at this point for 2 reasons. The risk of COVID to children is incredibly small. And, being vaccinated does not prevent the spread of COVID, so vaccinating our children isn't going to go very far to protect the risk population. Even if there weren't the possibility of side effects, why give our children a shot that provides little to no benefit.

If our Public schools mandate that our children get the COVID vaccine our plan is to remove our children from the public school system. We have been looking at private distance learning schools, and local home school groups just in case this happens. We hope that the state and schools do not take this course of action because our children are thriving with their current teacher and love spending time with all the other kids in their class. It would make life more complicated for us, and tighten up our budget as well, but not enough to force us into following a policy we believe is wrong for our children.

Thank you for giving parents the chance to voice their opinions. I hope this helps.

We reject the covid vaccination as a forced requirement in school. We have thosands of parents with us, and will pull our children out from public schools. We will vote down any future levies, as our children will not be attending public schools. We have been long time supporters and donaters of local public schools...and we wish to continue supporting you. We are in favor of optional Covid Vaccinations, as we see fit for our own children. Please make the right decision and leave our childrens health care, and vaccination decisons, in the hands of the individual parents.

Thank you,

In regards to requiring Covid-19 shots for public school. If this goes through my four children will not set foot in a public school again. As of this year I pulled my two school aged children out, as the Covid-19 restrictions in our public schools are not science-based and have turned our schools into environments that are not beneficial to my children. I had hoped that once the masks were dropped I could send my children back, but if a Covid-19 shot becomes a requirement I will be homeschooling indefinitely.

As you all are aware there is no current published literature on pediatric Covid-19 vaccine effectiveness in a K-12 setting. I would also remind you that children are not at any significant risk of serious injury or death from Covid-19, however they have been to the shots. That is an unnecessary risk I refuse to take. To date my household has had both Delta and Omicron variants, both times my kids barely got sniffles, with Delta they all had zero symptoms (ages 2 months to 14 years old at the time). While studies show Covid-19 is not something we have to worry about with our kids, anxiety, depression, and suicide have become something families have to worry about due to all of the Covid-19 restrictions that are not science based and utterly ridiculous. As a concerned parent with school aged children I am appalled at the lack of common sense and denial of science in lieu of politics and it is gross. Let parents decide whether their children get the shots or not, as that is a decision that should be up for the parents as we are supposed to be a free nation or is that not a thing anymore?

External Email

Hello, I had a question about the data shared during the VAC meeting on 1/13/2022.

In the data that showed COVID-19 hospitalizations at the beginning of the meeting, is this:

a) looking at people who have COVID and are in the hospital? OR

b) looking at people who are hospitalized BECAUSE of COVID?

I greatly appreciate this clarification.

Thank you,

Shawna Hill

Subject: Public Comment - NO Mandates for Kids

External Email

This comment is in regards to your upcoming vote forcing vaccines into our children.

You must NOT vote to force anything into our children's bodies. That is the sole responsibility of the parent. This notion that you know better than parents is despicable and should be criminal.

These vaccines do NOTHING to stop the transmission of the virus and certainly do not prevent contracting the virus. There is absolutely no point to this policy and even less point to pumping these kids full of a vaccine that doesn't work.

Lastly these presentations are full of cherry-picked statistics and percentages. This is clearly a concerted effort to ram this policy through against the will of the people.

Counting cases is pointless as stated by countless experts in the scientific community. It is a metric that should never have been used for a baseline.

Lastly, why are you advancing this ridiculous policy when other states with far worse metrics are rolling them back? Why do hate our kids so?

I implore you. You must vote no.

Subject: Attn: TAG on Covid shots for K-12 - Covid shots suppress Innate Immunity

External Email

Hello TAG,

In your process of making the decision to possibly mandate Covid shots for K-12 I would expect you are doing a deep dive into the Safety of the Covid shots. Thank you for taking the time to read this email.

It is odd that Safety is something that is not brought up in the BOH and TAG meetings I have watched. Nothing negative is ever said about the Covid shot, which is extremely concerning.

The only concerns TAG had in their first meeting was about the inconvenience to parents/caregivers to get children to a shot and how the schools and childcares would keep track of who has been vaccinated.

The only thing I have heard from BOH is that Covid shots are safe and effective and that everyone 5 and up should get the shots. How can any medicine be safe and effective for ALL?

To help with your research, which you are doing on behalf of all Washingtonians and their Children, I am providing you with a research paper by Dr. Stephanie Seneff that explains how Covid shots suppress innate immunity, see link.

<https://www.authorea.com/users/455597/articles/552937-innate-immune-suppression-by-sars-cov-2-mrna-vaccinations-the-role-of-g-quadruplexes-exosomes-and-micrnas>

last week, Stephanie Seneff, Ph.D., describes a mechanism of the COVID shots that
results in the suppression of your innate immune system. It does this by inhibiting the
type-1 interferon pathway.

* The COVID

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fchildrenshealthdefense.org%2Fde>
jab can cause neurons in your brain to produce toxic spike protein, or take up circulating
spike protein, and the neurons try to eliminate the spike protein by transmitting them
through exosomes. The exosomes are picked up by microglia, immune cells in your
brain, which activate an inflammatory response, which can contribute to degenerative
brain disorders.

* Two microRNAs, miR-148a and miR-590, are central in this process. These microRNAs
— excreted in the exosomes along with the spike protein — significantly disrupt the type-
1 interferon response in any cell, including immune cells.

* On average, there are twice as many reports of cancer following the COVID shots
compared to all other vaccines combined over the last 31 years.

* The fact that the signal is that strong is even more remarkable when you consider that
most people don't think the COVID shot could be a variable in their cancer emergence, so
they never report it.

Sincerely,

Theresa Lane – Concerned WA parent

To whom it may concern,

I've just learned that the Technical Advisory Group is meeting to discuss the possible requirement of the Covid shot for children to attend school. I am adamantly against this requirement for many reasons.

First, our children are NOT dying of this virus. The survival rate is incredibly good for children across the board. Also, as shown the shot does little good in actually protecting our children from getting or spreading this virus so should have no bearing on their wellness. At this point I'm far more concerned with my children's social, emotional and developmental health; all of which have taken a hit during these mandates and pandemic lockdowns our state has implemented.

Second, as a parent of two children in elementary school, I cannot fathom putting something into their little bodies that has zero published data or papers on the effectiveness or side effects of this shot on K-12 children. Many of these studies are still being completed and I will not allow my children to be an experiment.

Finally, as this virus has mutated several times already and the shots are constantly not able to keep up with the mutations, I'm not sure why we would think it a good idea to require this as it will become essential to get continual boosters and "updated" shots each year. Much like the flu vaccine.

I hope, as a board that has the best interests of our public health at heart, you would consider the many reasons our children should not be required this shot to attend school. Their education should never be put at risk by something that has shown its ineffectiveness time and time again.

Thank you for your time,

Jill T.

Hello Board Members,
As a high school English teacher in Monroe, WA I can tell you that many of my students are hanging on by a thread due to all the shutdowns, online schooling, and mask requirements. If you require vaccinations that will likely be the last straw for many of my students. They'll drop out and try to get jobs instead of putting up with one more roadblock to their education.

If you care about kids, don't be the cause of many of them leaving school in exasperation!

External Email

To Whom This May Concern,

Thank you for your time and consideration reviewing my email. I write to you as a concerned parent and citizen as we continue down a strange Covid Policy path that is leading to a dark forest of unknowns.

At this current writing I ask that you take a look around the globe and see what is happening everywhere from Canada to New Zealand. In Canada tens of thousands of people (truckers and citizens) are at the capital refusing to leave because of mandates. In Australia they are not allowing unvaccinated people to participate in society as normal as well as a new policy that won't allow you to visit your child in a hospital unless you are vaccinated. In Washington State you can't go to your favorite restaurant any longer if you are not vaccinated, in some parts of the state you can't go into a public setting without revealing your private health status and showing your vax pass. In Austria they are starting to enforce mandatory vaccination and have press releases stating they will be going door to door with hired personnel. In the U.S. people are losing their jobs for not being vaccinated under the guise of the health policy that protected (vaccinated) folks are at risk of catching covid from unvaccinated folks, so we have to fire them because the protection some received isn't good enough to prevent them from getting sick from those who haven't received it? You can't even make sense out of what the policy is supposed to do? There is no logic here.

Around the world people are protesting these Covid mandates and passes, they are tired, they are scared (not of covid), they are extremely pissed off, and they all protesting for the same reason. Heavy handed mandates and Covid policy is not working and it is taking away freedoms from society as a whole and destroying their families. No one is out here protesting for more masking, more policy, more vaccination, or more bureaucratic assistance. It is effectively time to step away from trying to help and let people live their lives again. Everyone and I mean everyone is over the Covid period in history. There is no reasonable means for a state of emergency or mandates any longer. We have exhausted every tool and reasonable policy and have not changed anything over the course of Covid or the outcomes for 3 years. We have however effectively destroyed careers, lives, families, childhood development, traditions, societal norms, culture, businesses, etc. and continue to press harder, why?

The government and reputable sourced and peer reviewed data tells us only comorbidity sick or elderly folks are at high risk. The data tells us children aren't at risk, never have been. The data tells us hospitals aren't treating it correctly as more people die with covid at the hospital than at home. The data tells us the kitchen sink approach to defeating covid hasn't slowed the spread or stopped Covid. What are we doing? Is the risk of Covid spread greater than societal destruction and our children itself? The CDC's own data suggests 99% of folks survive covid, and that was before vaccinations were even available.

Today a study came out from the respectable and highly credentialed John Hopkins Institute for Applied Economics, Global Health, and the Study of Business Enterprise, you can read it here. <https://sites.krieger.jhu.edu/iae/files/2022/01/A-Literature-Review-and-Meta-Analysis-of-the-Effects-of-Lockdowns-on-COVID-19-Mortality.pdf>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fsites.krieger.jhu.edu%2Fiae%2FfiLiterature-Review-and-Meta-Analysis-of-the-Effects-of-Lockdowns-on-COVID-19-Mortality.pdf&data=04%7C01%7CWSBOH%40sboh.wa.gov%7Cffb79926b9d34d430a7e08d9e5d76f8b%7C>. I'm not sure how much more data we need to prove that public health approach didn't work for multiple reasons, one of which is denial of effective treatments at all stages.

The study is frightening and thorough in highlighting the destruction of last years lockdowns and continued mitigation efforts today. The impact it has had on society, children, business, etc. is heartbreaking and unjustifiable. This needs to stop now.

Another study here, <https://brownstone.org/articles/a-partial-list-of-the-myrriad-abuses-that-facemasks-inflict-on-our-children/>

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fbrownstone.org%2Farticles%2Fa-partial-list-of-the-myrriad-abuses-that-facemasks-inflict-on-our-children%2F&data=04%7C01%7CWSBOH%40sboh.wa.gov%7Cffb79926b9d34d430a7e08d9e5d76f8b%7C> highlighting just some of the abuses that Facemasks have inflicted on our children. This article is heart wrenching and leaves one disgusted. Our leaders should be ashamed of themselves. These kids cannot go on living like this, people in general cannot go on living like this. The continued Covid policies affect the poorest families, minorities, and our most fragile citizenry the hardest. For a governor and state majority who is majority liberal by voting numbers constantly touting diversity and inclusion, unity etc. these policies are the exact opposite. Our leaders have lost their way as Americans, we are using top down policy approaches that are destroying commerce and unity amongst the very people they were elected to support.

When does it end? Where does it end? What are we doing? Folks have lost so much faith in government, schools, leaders, boards, institutions, you name it. People and I mean 99% of people just want their lives back and the policies are now preventing this from happening. The children of the world are being abused by these policies, this is not acceptable. No one wants to continue down these path's. We have had ample time for folks to get shots, get healthy, take measures, etc to prevent themselves from getting severe Covid. Those who haven't or choose not to are not going to now by taking more of their freedoms away. They will just fight harder, speak louder, and get more bold in their actions. You will create more division, more hate, and more destruction. Is the Washington State Board of Health and our Government officials going to take responsibility for this?

Natural Immunity is the answer to solving covid but we cannot even recognize it in this country, why? Natural covid immunity stands for nothing, why? This goes against all science and progress we have made throughout history and it is effectively undermining your own policy and respect for governing. Everyone knows natural immunity reigns supreme and the more folks out in society with it the better. But yet we continue to mask and mandate and dampen the affect natural immunity would have at helping resolve this quicker?

Please for the love of society and all things right in your stomach and hearts stop with the overreaching heavy handed policy. Listen to your gut. We are not operating with compassion here. Stop with the mandating of vaccines for kids in schools, there is no logic, no data, and no reasonable outcome for this policy to even be discussed. If there is data available then be transparent, justify it, display it, don't allow this to continue down tyrannical and draconian paths of dystopia. Parents are not happy about this. We don't require FLU shots every year for schools, why require for covid? What is it doing to people that is so justifiable that we must enforce or support mandatory vaccination especially for the children? Why is covid so scary to people, is it because of the non stop social media and messaging campaigns?

Thank you for your support. NO MANDATES NO MASKS NO MORE NOW!

Sincerely,

A compassionate and reasonable citizen.

Subject: Local Official Responses to Health in Spokane Cty

External Email

I write for guidance on how I can have impact on the below. Alternatively, I hope DOH is aware and engaged re: how aberrant Spokane's city and county approach has become to health, particularly pandemic responses.

The below link includes information on the most recent chapter of many following the firing of Dr. Lutz in Spokane Cty. and officials' efforts to avoid conventional health response in Spokane City and County. It is fruitless to contact the Commissioners (or—one the city side--the Mayor regarding her lack of engagement with compliance, such as re: City Council member Bingle, who refuses to wear a mask. The mayor distances herself from his censure, leaving the city attorney act as a policy maker, another departure from norms). It is quite possibly unsafe to raise issues at meetings, given incidents at various public forums in the area. Of course, masking isn't enforced here, with even some official offices (e.g., sheriff offices, for example) openly opposing masking and leading to increasing radicalism of those who oppose the mandates. All very discouraging . . .

<https://www.spokesman.com/stories/2022/feb/01/spokane-county-commissioners-could-pick-a-naturopa/>
<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.spokesman.com%2Fstories%2Fspokane-county-commissioners-could-pick-a-naturopa%2F&data=04%7C01%7Cwsboh%40sboh.wa.gov%7Cbce00054ba4844bd437908d9e5bf7204%7C>>

I recognize there are limits to what DOH can do. Many of us miss the days of Dr. Lutz and conventional, trusted health responses to pandemic and other social/health issues. At least then the regional health district and commissioners had a voice of reason to which to listen. Now, they are walking such a different path and I fear increasingly for health in our area.

I am weighing in on the 2 agenda questions. #5: does the vaccine prevent disease? Definitely not. It has no effectiveness on Omicron or Delta. It was only effective on the original strain of Covid. As a matter of fact, now it seems to infect the fully vaccinated more.

#6: Does the vaccine reduce the risk of person-to-person spread: Absolutely not. See above. If it does not prevent the disease then it will not reduce person-to-person spread. It might even accelerate it.

External Email

To the TAG Team,

Vaccine Mandates are ILLEGAL, UNCONSTITUTIONAL AND A CRIME AGAINST OUR CHILDREN.

This Injection was Mandated under an Emergency Use Authorization. It is Not approved by the FDA. It is an Experimental

Drug, not a Vaccine. If you want to be part of this experiment, that is your choice. But this must ALWAYS be a personal, private choice for

Every Parent and Human Being, when there is risk of Death or Injury.

When it comes to our CHILDREN, this is where WE the PARENTS and THE PEOPLE DRAW THE LINE IN THE SAND.

People are DROPPING DEAD from this KILL SHOT WORLD WIDE. Of course, you will not hear about this in mainstream media, which is controlled

by the Pharmaceutical Industry. They have censored all the victims.

Any forced injection on a human being, is no different than rape. This is a murderous crime against our children! Covid death for children is 0 percent!

Have you forgotten the Nuremberg Code? OUR CHILDREN ARE NOT YOUR PROPERTY!! MEDICAL FREEDOM IS A GOD GIVEN RIGHT!! THIS IS A WAR AGAINST OUR GOD!

GOD did not make a mistake when he made our Miraculous Immune Systems, if we only take care of them properly.

If you aren't on the side of GOD, THEN WHO'S SIDE ARE YOU ON? THIS IS GOOD AGAINST EVIL AND YOUR PARTICIPATION IN THIS MANDATED INJECTION, IS EVIL

TO THE CORE. MANY CHILDREN WILL DIE AND BE INJURED FOR LIFE, FROM THIS INJECTION.... AND IT WILL BE BY THE HANDS OF YOU TAG TEAM!!!

THIS IS AN UNCONSTITUTIONAL ACT AND WE WILL NEVER COMPLY!!!! LIBERTY IS A GIFT FROM GOD, NOT MAN.

STAND UP AGAINST MEDICAL TYRANNY, WHILE YOU STILL CAN, BEFORE IT'S TOO LATE, AND YOU WITNESS YOUNG, INNOCENT, CHILDREN BEING MURDERED IN FRONT OF YOUR EYES

BY THIS KILL SHOT!!!

YOU WILL BE HELD ACCOUNTABLE!!!!!! EVERY ONE OF YOU.... BEFORE YOUR GOD!!! AND MAN!!!

Dear Mr. Glasoe,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

Why are we pushing the vaccine requirement for COVID-19 when the child mortality rate due to COVID is so low our children have NEVER been required to submit to an annual vaccine.

With childhood deaths being so low why is this even being considered....

I will pull my all my children from their school's if this is the case

All I see for this COVID vaccine requirement in schools is DEPRIVING CHILDREN OF A PROPER EDUCATION.

The flu shot has never been required neither should the COVID shot.

My family and I have all had COVID and it's came and gone just like a slightly tougher cold/flu combination as with any virus as long as you stay hydrated, eat healthy foods and sanitize your home it shall pass.

I hope my letter is met & considered with all sincerity,

Letha L. Swanson

THE NUREMBERG CODE

1. The voluntary consent of the human subject is absolutely essential.

This means that the person involved should have legal capacity to give consent; should be so situated as to be able to exercise free power of choice, without the intervention of any element of force, fraud, deceit, duress, over-reaching, or other ulterior form of constraint or coercion; and should have sufficient knowledge and comprehension of the elements of the subject matter involved, as to enable him to make an understanding and enlightened decision. This latter element requires that, before the acceptance of an affirmative decision by the experimental subject, there should be made known to him the nature, duration, and purpose of the experiment; the method and means by which it is to be conducted; all inconveniences and hazards reasonably to be expected; and the effects upon his health or person, which may possibly come from his participation in the experiment.

The duty and responsibility for ascertaining the quality of the consent rests upon each individual who initiates, directs or engages in the experiment. It is a personal duty and responsibility which may not be delegated to another with impunity.

2. The experiment should be such as to yield fruitful results for the good of society, unprocurable by other methods or means of study, and not random and unnecessary in nature.
3. The experiment should be so designed and based on the results of animal experimentation and a knowledge of the natural history of the disease or other problem under study, that the anticipated results will justify the performance of the experiment.
4. The experiment should be so conducted as to avoid all unnecessary physical and mental suffering and injury.
5. No experiment should be conducted, where there is an a priori reason to believe that death or disabling injury will occur; except, perhaps, in those experiments where the experimental physicians also serve as subjects.
6. The degree of risk to be taken should never exceed that determined by the humanitarian importance of the problem to be solved by the experiment.
7. Proper preparations should be made and adequate facilities provided to protect the experimental subject against even remote possibilities of injury, disability, or death.
8. The experiment should be conducted only by scientifically qualified persons. The highest degree of skill and care should be required through all stages of the experiment of those who conduct or engage in the experiment.
9. During the course of the experiment, the human subject should be at liberty to bring the experiment to an end, if he has reached the physical or mental state, where continuation of the experiment seemed to him to be impossible.
10. During the course of the experiment, the scientist in charge must be prepared to terminate the experiment at any stage, if he has probable cause to believe, in the exercise of the good faith, superior skill and careful judgement required of him, that a continuation of the experiment is likely to result in injury, disability, or death to the experimental subject.

Re: Washington State Board of Health
Technical Advisory Group
Comments to Public Meeting
Agenda Items # 5 & 7 – Review of Criteria 5 & 6

To Technical Advisory Group (TAG):

The experimental COVID “vaccines” do not meet Criteria numbers: 2, 4, 5, 6, & 7, of the "Criteria for Reviewing Antigens for Potential Inclusion in WAC 246-105-030" (CRAPI). Science and children’s inherent immunities do not support the implementation of COVID “vaccines” for K-12. It is beyond understanding why it is taking so long to deliberate something that is as straightforward as this. COVID “vaccines” absolutely, irrefutably, unconditionally do not meet the Criteria under discussion today, nor did they meet the Criteria under discussion at the last public TAG meeting.

But let’s focus on what is in today’s Agenda:

Criteria 2 - *“The vaccine containing this antigen is effective as measured by immunogenicity...”* **False:** The COVID "vaccine" should not be considered a vaccine because it is not effective at PREVENTING transmission of the disease, so says the Director of the CDC.¹

Criteria 4 - *“Experience to date with the vaccine containing this antigen demonstrates that it is safe and has an acceptable level of side effects.”* **False:** The COVID "vaccines" have passed the one-million mark for adverse effects. For the negative effects on children, please see attached data spreadsheet “Attachment A - VAERS Report Children 5 – 11,” (an excerpt from the VAERS data report for 2021)². The report is shocking and illuminating in that many “accidents” are reported as occurring as a result of the administration of the shot, thus making the jab by untrained personnel almost as dangerous as the “vaccine”. Also in this report are the suicides; sixty-six children, ages 5-11, committed suicide in 2021, their deaths counted as COVID.

Why is TAG and BOH taking such unnecessary risks with our children when our children are not in danger of dying from the disease,³ or of experiencing much more than flu like symptoms?⁴ That’s the million-dollar question: WHY ARE YOU DOING THIS TO OUR CHILDREN?

How many members of the Technical Advisory Group adopt science based, critical thinking in your decision making? Have any of you carried out any research into alternatives to the “vaccine”? (It is estimated that 500,000 people have died in the last eighteen months because they were denied (by Fauci) preventative

¹ <https://www.msn.com/en-us/health/medical/cdc-director-covid-vaccines-cant-prevent-transmission-anymore/ar-AASDndg>

² <https://vaers.hhs.gov/data.html>

³ <https://petition-central.com/new-data-covid-was-never-more-dangerous-to-young-adults-and-children-than-seasonal-flu/>

⁴ <https://www.newsweek.com/risk-kids-covid-miniscule-do-not-let-them-mandate-vaccines-opinion-1638576>

treatments like Ivermectin and hydroxychloroquine.)⁵ How many in this Group have conducted research into the corrupt and sociopathic practices of Anthony Fauci and Bill Gates, amongst others? (Gates, Fauci and other world leaders are currently being investigated in preparation to present before a Grand Jury, in an International Court for Crimes Against Humanity.^{6 7}

Fact, every doctor, nurse, health care worker, politician, educator, and others in positions of power that promotes the COVID “vaccine” as the ONLY effective treatment against COVID is guilty of Crimes Against Humanity under the Nuremberg Code. Mandating this “vaccine” breaks not one but every one of the ten “crimes” under the Nuremberg Code (Attachment B). Current scientific studies do not support you and your position in the Technical Advisory Group will not protect you if you approve this “vaccine” for children.

On Thursday, February 10, 2022, you will be deciding the future of the children of the State of Washington—will 99.996% of them live if they get COVID or will some of them die unnecessarily from the “vaccines” adverse effects? That’s not a question asked for dramatic impact. Your recommendation to Washington State Board of Health holds weight and children’s lives are dependent upon you doing the right thing by them. And let’s be clear, to say that parents can opt out of the “vaccine” is as hollow as proclaiming the rest of us have that luxury. Two years of draconian mandates have declared otherwise.

Your recommendation to BOH should be a resounding **NO to the COVID “vaccine” K-12** mandate.

Sincerely,

Gayle Baker

WAC 246-100-040

Opinion Regarding Procedures for isolation or quarantine.

I find it terrifying to see this happening in our state. It effectively removes our civil and constitutional rights. There is a name for it, a dictatorship. I see us moving toward the same horrors that are happening in Israel, Australia, Austria, and China.

This WAC allows the health department to be judge, jury and executioner based on “their” opinion and assessment? Who should have that amount of power over another individual? No one. What makes the employees of the health department so superior that they know what is best for another person?

I would not want to be the individual making decisions listed in this WAC. I would not even want to know the person who could justify taking the actions listed in this WAC. What is the moral and ethical character of the employee/enforcers? The only persons who could do such work must have a personality that is sociopathic and not with conscience. This can only lead to abuses. It has happened in the past many times.

10 stages of Genocide- Perhaps this will be a good reminder of the slippery slope we are on. I believe we are in stage #7 of this genocide and moving towards #8. Please review and maybe you can dismiss this in your own mind, and justify the actions listed in the WAC as just, “Protecting the population.” Nothing like being the “Good German.”

Dr. Gregory H. Stanton is Research Professor in Genocide Studies and Prevention at the Institute for Conflict Analysis and Resolution, George Mason University, Arlington, Virginia.

1. Classification: People divided into “Us” and “Them”
2. Symbolization: People are forced to identify themselves.
3. Discrimination: People begin to face systemic discrimination.
4. Dehumanization: People equated to disease, vermin, and animals
5. Organization: Government creates special groups to enforce the policies i.e. “Strike team” or police/military.
6. Polarization: Government broadcasts propaganda to turn the populace against the group.
7. Preparation: Official action to remove/relocate people begin.
8. Persecution: Beginnings of murder, theft of property, trials, massacres.
9. Exterminations: Wholesale elimination of the group. It is extermination and not murder because the group is not thought of as human.
10. Denial: The government denies it has created any crimes.

The verbiage of this WAC is vague. What will the criteria be for a health official to issue an emergency detention order? Will it be because the person or persons refuse to take a vaccine? Will it be because they have cold and flu symptoms? Gosh, I have had many of those. Maybe an elevated temp? Will it be because I write a letter against the CDC or FDA? What if I inform others about VEARS, that 21,000 people died because of the vaccine, which only represents 1% of the actual number reported (according to Harvard) or the 1,000,000 who have been injured? Will parents who refuse to vaccinate their children be vilified and the children taken away? There is plenty of words to describe the legal this and legal that, and we all know what a nightmare that would be. Nothing like being placed in a concentration camp or whatever nice word you wish to call it without representation, without committing a crime. Who will be helping the people who are being harassed and terrorized by these health officials? Who will be liable for damages done to people? Emotional trauma, financial loss, physical harm due to forced treatment, no one wants to be liable for the damages they cause. This will equal a crime against humanity and those who participate will be guilty.

This is a pathetic power grab and has nothing to do with public health. ***Dictatorship***, form of government in which one person or a small group possesses absolute power without effective constitutional limitations. There should never, ever, be that much power given to an individual or agency based only on sole discretion.

Please do not mandate Covid 19 vaccines for children to attend public or private school. Children have robust immune system's. Currently there is no published literature on pediatric Covid-19 vaccine effectiveness in K-12 school setting. In addition, Covid -19 is not life threatening to children as seen in the data. Suicide is the 3rd leading cause of death among children 15 to 19. The effects that this vaccine can have on children is more detrimental to them and their overall health than contracting COVID-19. Parents and families should have the right to make decisions regarding what is being put into their children's bodies that might affect them or harm them. These COVID-19 vaccines do not have enough data to prove beneficial. And we do not have long-term studies to show that they are more beneficial then harmful. Please vote no on mandating COVID-19 vaccinations for children.

A concerned parent,

Hello,
☐

I am opposed to making COVID-19 shots mandatory for school admission or childcare in our State for the following Reasons:

A)

"15,000 physicians and medical scientists around the world signed a declaration publicly declaring that healthy children should NOT be vaccinated for COVID-19. On behalf of these MDs and PhDs, Dr. Robert Malone, who has devoted his career to vaccine development, provides parents a clear statement outlining the scientific facts behind this decision."

<https://globalcovids Summit.org/news/live-stream-event-physicians-alerting-parents>

B)

"The vaccines are associated with higher rates of COVID-19 infections and higher rates of COVID-related deaths. In the US, the vaccines were associated with an increase of 38% in the number of COVID cases per million and an increase of 31% in the number of deaths per millions associated with COVID."

<https://stevekirsch.substack.com/p/new-big-data-study-of-145-countries?r=u75lc>
<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fstevekirsch.substack.com%2Fp%2Fnew-big-data-study-of-145-countries%3Fr%3Du75lc&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C093a77a70ccb400b9ac508d9e2>>

C)

Nobel Prize Winner Dr. Luc Montagnier: Omicron Makes Biden's Vaccine Mandates Obsolete

"It would be irrational, legally indefensible and contrary to the public interest for government to mandate vaccines absent any evidence that the vaccines are effective in stopping the spread of the pathogen they target. Yet that's exactly what's happening

here.”

<https://www.wsj.com/articles/omicron-makes-bidens-vaccine-mandates-obsolete-covid-healthcare-osh-evidence-supreme-court-11641760009>

I could go on and on with more data and information similar to the above, but we all know and have all experienced the fact that people who are vaccinated are still getting sick and are still spreading the virus. There is absolutely no reason for any mandates when this vaccine cannot stop the spread or prevent a person from contracting covid.

We implore you to reconsider any vaccine mandates.

Regards,

Ingrid and Randy DeHaan

Subject: SARS-CoV2 Vaccine Consideration for School-Aged Children

REC'D
JAN 28 2022

I am a parent of three children.

I do not believe our current SARS-CoV2 vaccines meet criteria #6 of the nine criteria outlined in the document titled *Immunization Advisory Committee: Criteria for Reviewing Antigens for Potential Inclusion in WAC 246-105-030 updated November 8, 2017*.

Dr. Anthony S. Fauci co-authored an article on December 15, 2021 for The New England Journal of Medicine titled 'Universal Coronavirus Vaccines—An Urgent Need'. This article states, "The limitations of SARS-CoV2 vaccines suggest that they will ultimately need to be replaced by second-generation vaccines that induce more broadly protective and more durable immunity." Dr. Fauci is already moving past our first-generation vaccines.

The high infection rate in our communities supports that the SARS-CoV2 vaccines will need to be replaced. They are not providing much, if any, reduced person-to-person transmission or durability.

We should not rush to include Emergency Use Authorized (EUA) products to our immunization schedule.

Lastly, the document *Immunization Advisory Committee: Criteria for Reviewing Antigens for Potential Inclusion in WAC 246-105-030 updated November 8, 2017* lacks criteria for the removal of antigens. By only including reasons an antigen should be added to the vaccine schedule and not why antigens should be removed, the committee is narrowly focused on addition and may overlook the bigger picture. What is the cumulative effect of adding vaccines? What are the interactions when administering multiple vaccines at one time? When is a vaccine out of date and no longer a good match? What are the limits when stimulating the immune system with antigens?

Please understand, my children followed the vaccine schedule. I was vaccinated with the SARS-CoV2 vaccine. But the SARS-CoV2 vaccine has left me with more questions than answers about all vaccines.

For these reasons, I do not support adding SARS-CoV2 to the vaccine schedule.

Subject: School Covid vaccine - YES!

External Email

I'm writing to share my opinion on the school vaccine requirement. I understand there is a request for those opposed to email you so I wanted to share that I feel this Covid vaccine is no different than any other vaccine required to attend a PUBLIC school. I am all for vaccines, believe in the science and want my kids to be protected from all the preventable diseases that vaccines protect them from, including a severe case of covid.

Those who do not wish to vaccinate against any of the preventable diseases have the right to home school or start a commune. Let's stop politicizing a virus and if that's not possible, I feel Polio needs a launch a PR campaign because I haven't heard that any side has claimed that one as theirs yet.

Jenn Martin – parent of two kids in the Snoqualmie Valley School District

As my highly educated friend stated, and I agree: "This is a hard NO from me as there is zero reason to recommend the covid injections for our children (or anyone for that matter). These injections do not limit transmission nor are they limiting hospitalizations over-all (adjusted for health-bias) to those at most risk. Not to mention, as of January 28, 2022 there are over 23,000 COVID19 Vaccine-related DEATHS, and over 1,000,000 COVID19 vaccine confirmed injuries. Additionally, most of us are already covid-recovered and there is clear evidence acquired immunity is the gold standard (as it has always been) with more robust and durable immunity than any AB found post vaccine. The vaccines are waning after 2 months and worthless after 6 months. SARS-COV2 is not a disease of the young. The innate immunity of young people destroys COVID19 in all variants. To even consider these injections as recommended for our young people displays gross negligence on behalf of this advisory group. This group should be dissolved immediately and issue a public statement as to the NON RECOMMENDATION for any consideration of these dangerous injections for our children. Anyone who gives their child this injection is indeed risking their child's health and well being and very life. Whereas covid infection, disease and recovery is nearly ZERO risk comparatively."

I am personally covid-recovered as well as my husband and 3 children and we all have natural immunity and I will share our covid story with you: I was personally infected with Covid-19 in late January 2021, over 1 year ago, but the rest of my household did not become infected at all during my illness. They themselves did not contract the virus until late August/early September of 2021 (another variant I assume) and they all recovered with no problems. Incidentally, I took care of each one of them, one after the other in a 3- 4 week span of time, I never quarantined away from them and actually continued to be in close proximity to them as a mother would take care of their children and husband if they were infected with any other virus, and guess what? I NEVER GOT REINFECTED! I share this with you because that is a BIG WIN for the human body's ability to fight off infections and I am living proof! My natural immunity protected me considerably and more efficiently than any lab created test injection. (I will not even lie and address these toxic injections as a "vaccine".) These trial injections are not tested per the usual government standards or regulations and are not proven safe or effective and in fact have proven to be ineffective and dangerous to the human body. I will never go along with anyone playing "russian roulette" with my children's lives! Stop the insanity and please say no to any COVID 19 vaccine requirement for our children!!! It is NOT SAFE, NOT EFFECTIVE AND COMPLETELY UNNECESSARY!

To whom it may concern,

I am writing to voice my concerns regarding the upcoming vote to require a covid vaccine for children to attend school.

Over the last two years, public school attendance has dwindled, while homeschool and private school numbers are increasing. How much of that is because of new mandates from Corona fears? Is forcing another vaccine really worth jeopardizing the funding of public education now and in the future?

Please keep in mind that this is not a long term safety tested cure all, it is still a new vaccine; heart attacks have been on the rise in a younger population and is there a link? Nobody knows because there has not been enough time to test long term side effects of this vaccine. Are you really willing to use our children as guinea pigs?

Furthermore, people who are up to date still catch and spread Covid-19. In most people covid presents itself as a cold or mild flu symptoms. Most people do not die or have long term difficulties from this minor infection. How is requiring a vaccine going to change that? It won't!

The covid shot should absolutely not be mandatory for school age children, please remember your duty to encourage personal responsibility and uphold freedom of choice, as well as bodily autonomy. Please do not risk driving more families away from public education by voting on the side of control with fear and misinformation as your motivation.

Sincerely,
Leah Dowd

This is the recent interview from Dr. Meissner. We will not comply to harm our children to attend school.

Dr Cody Meissner, the chief of pediatrics at Tufts Children's Hospital in Boston and a member of the FDA's Vaccines and Related Biological Products Advisory Committee (VRBPAC), doubted whether the vaccine is needed for group which already suffers such low risk of hospitalization or death from Covid.

'I think we're rethinking the way we looked at this question, because even though people are appropriately vaccinated they are still able to become infected and transmit the virus to susceptible people around them,' Meissner told DailyMail.com.

'So this is a little bit different than many other infectious diseases such as measles, or mumps, or rubella. If you're protected from infection with the vaccine, then you're not going to transmit it to other people.'

'But that's not the same setting with [this virus].'

Subject: Local control to lift mask mandates

External Email

Dear Mr. Thai,

My name is Erica Teodoro and I am the parent of two students in the Peninsula school district.

I am writing to you today to ask that you please consider giving local control to the Washington school districts as to whether or not to lift mask mandates in schools. Schools around the country are starting to create exit plans for the mask mandates and it seems reasonable that our schools should be allowed to do the same should they see fit.

My kids have noticed a stark decrease in morale at their schools compared to pre-pandemic due in part to teachers having to use precious education time instead to police masking. They didn't sign up for this, they aren't trained for this, and everyone's patience is wearing thin.

Please, help our students get back to the business of growing and learning and thriving in their schools by allowing the individual districts to make the choice to lift mask mandates.

Thank you for your time,

Erica Teodoro

Please look at the data carefully before you impose an experimental injection on our children that could have potential negative effects on their long term health. These injections don't prevent the transmission of Covid or protect one from getting it. Children are at minimal risk of having a serious illness unless they have comorbidities. There have been minimal deaths in children. The risk to them outweigh the benefits. This injection doesn't meet the qualifications for making it mandatory. I listened to your first zoom which gave clear indications that it didn't. Thankyou for your time.

Subject: No to adding the COVID shot to the schedule for children

External Email

Dear health decision makers,

I am writing to you as a concerned parent. Please do not vote to add the COVID vaccine to children's vaccination schedule. I find it very concerning that you are even considering adding this as we are nearing the endemic stage of this virus. The COVID vaccine does not get rid of COVID. Children are at the least likely to have severe side effects from COVID and are much more likely to have side effects to the vaccine. In Germany there was a study of 100,000 unvaccinated children who contracted COVID. 8 of those 100,000 ended up in ICU and none died.

On a personal note, I am not anti vaccine and I got the COVID vaccine myself. However, after my reaction to the vaccine, I cannot in good conscience let my children receive it. I had every side effect from the vaccine. I was sick for 5 days and half of my face went numb. My niece got the COVID vaccine and her face swelled up. My close friend received the Vaccine a year ago. She is still having side effects from the vaccine. She had/has heart inflammation and ringing in her ears. My hairdresser had blood clots after the vaccine. The worst side effect was my sister's friend's husband who died from the vaccine. I know COVID is severe, but I was fortunate enough to not know anyone who has died or been hospitalized from COVID. However, from my list above I do know people who have been harmed by the vaccine and these are just the ones I listed.

When the vaccine does not stop the spread of the virus, and we still have to social distance, and we still must wear masks, and we still might end up in the Hospital, why would you think we would agree to vaccinating our children who are the least at risk of COVID? If this vaccine becomes mandatory for my kids to attend school, I will be pulling them from public school and will homeschool them!

Please do the right thing and vote no on requiring this vaccine for school children!

Best regards,

Sarah Darboe

You have to have a good, solid answer to WHY?? Why the children, when there are already horrific affects from it for some children. It needs much more testing. WHY the vaccine and WHY the rush???

To whom it may concern,

As a parent of school age children in Washington State, I would like to respectfully request that you consider a couple of items as you decide if the COVID-19 vaccine should be added to required school immunizations.

First, according to statistics on the CDC website, schoolchildren have a very low risk of death due to COVID-19. There were 683 deaths from the disease in the group aged 5-17. At the same time, there are approximately 56.4 million school age children in the US, meaning a child in school has a .00012% chance of death from the virus.

Second, there have been adverse reactions to the vaccine, which is new technology. VAERS reports 43 deaths and 1,715 hospitalizations for 7,141,428 reported vaccinations. The risk of death from the vaccine (.0006%) is higher than the risk of death from the disease! Moreover, the vaccine has not been shown to prevent the disease or even reduce transmission, so rather than decrease the risk associated, it actually increases the total risk.

In conclusion, I do not believe this vaccine is a benefit to children in this age range and instead of decreasing risk it actually increases the total risk to the child's health. For this reason, I hope to hear that you have decided not to include it in the required school immunization list.

Thank you for your time and consideration.

Sincerely,

Rod Colvin

I'm very concerned about a potential COVID-19 vaccine mandate for children entering school. Yesterday, I attended the Vaccine Advisory Committee meeting. This committee is very "pro-COVID-19 vaccine" and presented a lot of data. My concern is that they did NOT include granular data that could paint a different picture including comorbidities, being hospitalized "with" or "for" COVID, adverse side effects, etc. This data is critical to informing the public and gaining trust and credibility. I have taken many statistics courses and I know how easy it is to manipulate data to further a particular point of view. I am glad to see that others in my community are recognizing this as well. I understand that sharing more detailed information could unravel the story that the committee is trying to tell. The Vaccine Advisory Committee actually spent a lot of time talking about how they are going to approach marketing to the unvaccinated, which personally, made me cringe. I am not an Anti-Vax'r. My family is vaccinated, with all the usual vaccines recommended for school age children. My family had COVID a few weeks ago and we are fine. I believe that the COVID-19 vaccine should be a personal choice, just like the flu shot. Each person needs to consider their own situation and health profile because, like it or not, a health profile matters a lot if you break out the data. According to the CDC, 75% of COVID-19 deaths were from people with 4 or more comorbidities. I don't believe that this vaccine is a "one-size-fits-all." My family will NOT be getting a COVID-19 vaccine, unless I see more data that convinces me that we really need it. Each person is unique and needs to weigh the pro's and con's with their physician. It is clear to me that the Vaccine Advisory Committee has an agenda. People are beginning to see through this. If this committee really wants to gain the trust of the unvaccinated they need to be willing to have an open conversation with physicians who have other opinions. My concern, and the reason that I am writing, is that by April, my families' choices will be limited because many private schools and alternative schools, will have already gone through their open enrollment phase for the following school year. As you are probably aware, within the last year, enrollment in Private schools and home schools have skyrocketed. Therefore, parents need time to make plans for their families. My husband and I have discussed the risks for our family and if we don't get a clear answer about this potential new requirement shortly, we will go ahead enroll in private school, which will allow for exemptions, without any weird singling out that could happen in public school. This way we can ensure that our children can get an exemption and we can move on with our lives. I think this is weighing heavy on a lot of parents. I think the Department of Health needs to recognize the bias of the Vaccine Advisory Committee and seek more public opinion. I have been in contact with my local School Board, and I hope that they will choose to seek public opinion as well.

I can't get a decent answer as to WHY we are in such a hurry to get children vaccinated....???

Lots of rumblings are coming out about the negative affects the shot has already had on children. And, these affects are not reversible. They are permanent. PLEASE WAIT....fully test it....put the children first....

Hello TAG board,

You cannot in your consciousness and available data add covid 19 to the required list of vaccines for children.

With 200x fold risk in myocarditis/pericarditis cases amongst young males and ZERO efficacy at preventing the spread you will knowingly put children's health at risk!

The vaccine is not approved for children and carries ZERO benefit to a healthy children and risk are by far outweigh any hypothetical benefit. There is ZERO long term studies on how it can affect children 3, 5, 10, years later.

Should the board approve adding CV19 vaccine to the list of vaccines required for school, the board will commit gross negligence against children.

Thanks,
Anna

1,104. If the risk of an adverse event is even close to this in kids under 5 years old, it doesn't make any sense to approve a vaccine in this age group when we have absolutely no evidence of benefit. Thus, the third criterion hasn't been satisfied.

Finally, we have the question of whether there are adequate, approved, and available alternative treatments. It's less clear how to answer this question for young children. But to a certain extent, it's a moot point because the Pfizer vaccine has already failed the first three of the four criteria that need to be met in order for an EUA to be approved.

Nevertheless, Pfizer has submitted an EUA application, and the FDA will review it on February 15. I cannot for the life of me understand how the FDA can review an EUA application when there are no data on the vaccine's efficacy to support the application!

This is incredibly disturbing. The FDA seems to be rushing to approve a completely unproven medical treatment for an age group that is at extremely low risk for the disease that product is intended to treat.

Where is the emergency? Why should this be rushed? We're talking about the health of our children here—and in this case, the health of our youngest and most vulnerable kids.

If the Pfizer vaccine is approved for kids under 5 years old, most parents will (understandably) assume that it has been shown to be effective and safe. That is not the case.

Aaron Siri (who has sued the FDA to force it to release the documents it relied on to approve the Pfizer EUA) has been writing about this issue, and I think this paragraph from one of his recent articles

sums up the predicament we are in:

“Just look at this circus – the government mandates Pfizer’s product, gives it immunity for any safety or efficacy issues, promotes its product using taxpayer money, gives Pfizer over \$17 billion and then uses taxpayers’ money to fight to avoid providing even the most basic level of transparency to the public.”

This is not how science and medicine should work. We need more rigor, more transparency, and more oversight from the federal agencies that are supposed to play this role.

Subject: Health survey for requiring COVID vaccine for students

Hello, I just found out about the Health survey for requiring COVID vaccine for students in the State of Washington

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fsboh.wa.gov%2FNews%2FArticles-Surveys-Now-Available-Parents-and-Caregivers-Provide-Feedback-to-the-TAG-Responses-Accepted-Until-Wed-Feb-2&data=04%7C01%7Cwsboh%40sboh.wa.gov%7C313974b1f4f74ed17bca08d9e73d202f%7C11d0e21726>>
and when I went to click on the links, it showed they were already closed.

It unfortunate there was such a low amount of responses that could be recorded and how little it was publicized to ensure it reached all parents. The schools send out vaccine clinic emails once a week but couldn't send one email asking for parents feedback for this forced mandate on a broad scale.

I strongly reject the idea of a vaccine mandate for school age children in the state of Washington. I live Bothell and my 7 year old attends the North Shore School District. With weekly testing the North Shore District has not had any major outbreaks. With weekly testing and proper remote school technology options in place, there is no need to risk kids life from having irreparable side effects.

I have been suffering from an adverse Pfizer vaccine reaction that has completely impacted my quality of life. I had no prior medical issues and now have daily neurological symptoms for which I am seeing 5 different doctors from neurologists, to immunologists, to holistic specialists for detox and 6 months later, I still have no relief after spending tens of thousands of dollars. I have reported it to VAERS, CDC and Pfizer and no one cares to help those injured from the vaccine.

I am not alone, there have been over 1MM adverse reactions reported to VAERs in the US alone. So many other countries are doing away with mandates and many colleges in the US have done so already.

If you enforce this mandate, you will thousands of parents pull the kids out from public schools which will greatly reduce you funding.

Please take this into have a proper survey via a proper survey tool to capture proper feedback.

Thank you for your consideration.

Jennifer Lazo

Subject: Commit to no COVID vaccine mandates on children

External Email

Dear Washington State Board of Health,

Our state government should NOT be mandating Covid vaccines on our children. Children are at extremely low risk for Covid and these medical decisions should be left in the hands of parents.

Sincerely,

The Citizens of Washington State

Subject: No to Covid-19 Coronavirus Immunization Criteria

External Email

Hello, Washington State Board of Health,

I am writing to you to request you not to put the Covid-19/or/Coronavirus (seasonal flue) Vaccination as a requirement for children to go to school in Washington State. You know that what you are requiring is against the constitution and against science. You know you are pushing this against people's will. You know the Covid-19 vaccine is not a true vaccine and it has caused many injuries in young people and killed many. And you are still pushing it for your own benefit!!!! "NO" to Crimes Against Humanity! Consider yourself served.

Vote NO on mandatory covid-19/coronavirus vaccination now and always.

DO NO HARM! Hipocratic Oath!!!

Rose Woodruff

Subject: Oppose Vaccine Requirements

External Email

I am writing today to express my absolute opposition to implementation of a COVID 19 vaccine requirement for schools in Washington State.

1. No COVID vaccine available in the United States has received FDA approval. All available vaccines, including the Pfizer-BioNTech vaccine, are being administered under an Emergency Use Authorization. The only "approved" COVID 19 vaccine is Comirnaty, and it is not available in the United States and there is no anticipated date for its availability. This "smoke and mirrors" approach by the FDA is the subject of numerous lawsuits and a Federal Judge recently rejected Pfizer's claim that the 2 products are interchangeable: Federal Judge Rejects DOD Claim That Pfizer EUA and Comirnaty Vaccines Are 'Interchangeable' • Children's Health Defense (childrenshealthdefense.org <<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Fchildrenshealthdefense.org%2F&da>) Since EUA products cannot be mandated per the Nuremberg Code, this alone should be enough to stop consideration of making vaccines mandatory.

2. Children are statistically at zero risk of dying from COVID. Their survival rate is in the range of 99.997-99.998% or, put another way, their risk of dying with COVID is less than 2 in every 1,000,000 children. The very few children who are listed as COVID deaths did not die OF COVID, but rather WITH COVID as anyone being admitted to a hospital nowadays is tested. I challenge the Washington State Board of Health to show medical records for even one child who has died OF COVID. Where there's no risk, there can be no benefit.

3. No one knows the long term risks of these vaccines. You may remember that one of the members of the FDA Advisory Committee famously said, "We are never going to learn about how safe this vaccine is until we start giving it" Dr. Eric Ruben, Editor in Chief NEJM The studies Pfizer conducted were woefully underpowered. This is an analysis of 10 Red Flags associated with Pfizer's studies: Ten red flags in the FDA's risk-benefit analysis of Pfizer's EUA application to inject American children 5 to 11 with its mRNA product – Commentary – America's Frontline Doctors (americasfrontlinedoctors.org <<https://gcc02.safelinks.protection.outlook.com/?url=http%3A%2F%2Famericasfrontlinedoctors.org%2F&da>)

Force vaccinating healthy children for a disease that doesn't affect them to make adults feel safe is a new low for humanity. Please do the right thing and do not require these vaccinations for school age children.

Thank you,

Renee Marceau

Subject: Comments on Jan BOH Meeting

External Email

Attn: Kaitlyn

I attended the zoom meeting on Jan 12, 2022, in its entirety, and was hoping for the opportunity to share my comments on Items # 8 and # 11. However, I doubt it would have made any difference.

Listening to all those that did verbally share, or made comments in the Q&A box, it was loud and clear that the voice of the people were in unison on their utter discontent of the Board of Health's direction on the matters.

It was also quite clear, based on how quickly the BOH voted to dismiss the Informed Choice Washington's Petition for Rulemaking, that your minds were made up on the matter before you even began that meeting.

It would seem that over 7500 Washington Citizens wasted their time supporting and/or commenting that day. But we ARE not going to be silent or denied our voice. And the number of those involved will double, then triple, and your meetings will need to be held more often and for longer periods so that we all get our 1 minute.

None the less, I just want it to go on record that I SUPPORT the adoption of ICWA's Petition for Rulemaking on agenda item 11, which asks the Board to establish a new rule that prohibits them from adding any Emergency Use Authorized (EUA) product, or any licensed product that lacks completed Phase 3 trial studies, to the school required list.

I also OPPOSE the Board's formation of a Technical Advisory Group (TAG) to review information about COVID-19 shots for consideration of mandating the shots for school. I oppose COVID-19 shot mandates, period!

I'm praying for you all and fighting this battle on my knees.

See you in March at the next meeting!

Sincerely,
Anne Burbank

Subject: WAC codes

External Email

To Whom it may concern,

We are writing this email as citizens of the state of Washington in opposition to using WAC 246-100-070, WAS 246-100-045, and WAC 246-100-040 to force an emergency order to involuntarily detain a person or group to be isolated in a quarantine facility following refusal to comply with above stated laws regarding Covid-19.

We are also in opposition to including the Covid-19 injections as part of the school immunization requirements using WAC 246-105. These vaccinations have not met the required testing time frame, and therefore long term effects are not known. It is also known that the percentage of children seriously affected by Covid-19 is very small.

Respectfully submitted,
Ken and Tracy White

Subject: Tomorrow's meeting

External Email

Dear Ms. Donahoe,

The present situation with omicron is no longer a health emergency. People are not dying from covid anymore, not in numbers that make for a public emergency. People have always died from influenzas and pneumonias, from car wrecks and drownings, and we don't abandon our God-given rights in an effort to stamp out all of these possible deaths. The extreme measures you contemplate in dealing with what has become a minor threat would further hurt adults and children instead of helping them. Whatever power structures exist in your Codes, you don't have a moral right to trample on peoples's '...life, liberty, and the pursuit of happiness.'

You have no moral authority to impose mandatory shots into people's bodies. People own their own bodies. You do not own other people's bodies. You may not do as you see fit with other people's bodies. The people who imprisoned Martin Luther King, Jr.—did they have the legal right to do that? The bus driver who asked Rosa Parks to go to the back of the bus—did he have the right to do that? The national guard and police who blasted civil rights protestors with water hoses and set dogs on them—did they have the right to do that? Yes, they had a "right" by the laws and policies of the day, but they were in the wrong. The hindsight of history shows to all that they were wrong. The truth will out; many people already know that it is wrong of you to contemplate involuntary detention of citizens. Future people will absolutely know it, just like we absolutely know who was right in the civil rights movement led by MLK.

We also know who was morally right when Japanese American citizens were involuntarily concentrated into camps. We know who was wrong. Monetary reparations and public apology was awarded decades later to Japanese American citizens—right here in WA—who were involuntarily detained into camps at that shameful time.

There will be only shame for those who act immorally to involuntarily detain and/or bully citizens and children into camps and near-forced requirement of experimental injections. We Americans know that our legal rights to "life, liberty, and the pursuit of happiness" are solid both in Constitutional law and in the moral law which is written in our hearts.

I urge you not to overstep whatever powers you have to do whatever you want in this little day. Tomorrow morning, please remember that both yourself and your fellow citizens alike are all 'created equal' and have 'unalienable rights.' We hold these truths to be self-evident, that involuntary detainment of citizens is wrong, and mandating experimental shots for children against the will of their parents is wrong. Please maintain the public trust by respecting our unalienable rights.

Sincerely,
Deirdre Forman
WA resident

RE: Urgent Notice to the Washington State Board of Health Regarding Mandating the Covid-19 mRNA Vaccines for All Students Across the State

Dear Kaitlyn,

i: a woman; Vija Rogozina; write a Notice of Liability to you; a woman, who at times serves as a Board Member and as a community representative.

i; a woman, do not consent to your heavy-handed approach to my health and health of my child. I do not give you the authority to impose any medical procedures on me, my child, or on any human being that does not choose of their own free will your offerings of "public health" in a vaccine trial. I follow medical science closely; raw data is clear that children have close to zero risk of covid death. No risk, no benefit.

Here are three reasons for NOT mandating genetic mRNA vaccine for all Seattle Public School students:

1. Please refer to the recent German study, which concludes that for COVID-19 related symptoms in 5-11-year old children without comorbidities the risk of death is zero.

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.medrxiv.org%2Fcontent%2F10.1101%2F2021.11.30.21267048v1.full.pdf>>

2. The Pfizer mRNA vaccine causes catastrophic side effects, particularly heart inflammation (myocarditis and pericarditis) in youth. The CDC's own analysis of "<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.cdc.gov%2Fvaccines%2Fadverse%2F2021-08-30%2F03-COVID-Su-508.pdf&data=04%7C01%7Ckaitlyn.donahoe%40sboh.wa.gov%7Cd160812d79994b47bc4708d9d53ce8b3>" Myopericarditis following COVID-19 vaccination: Updates from the Vaccine Adverse Event Reporting System (VAERS)" showed astonishing increases particularly in children ages 12-15, 16-17, and 18-24.

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.cdc.gov%2Fvaccines%2Fadverse%2F2021-08-30%2F03-COVID-Su-508.pdf&data=04%7C01%7Ckaitlyn.donahoe%40sboh.wa.gov%7Cd160812d79994b47bc4708d9d53ce8b3>>
<https://www.cdc.gov/vaccines/acip/meetings/downloads/slides-2021-08-30/03-COVID-Su-508.pdf>

3. Please review Pfizer's 6-month data. I'm attaching the document along with the link under "breaking news" called "More Harm Than Good." Although this is from Canada, we share lots of information, because we are all using the same vaccines.

<<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fwww.canadiancovidcarealliance.org>>

<https://www.canadiancovidcarealliance.org/>

I also urge you to go to the VAERS database and study statistics of adverse vaccine events and mortality. The numbers reached over one million cases in December 2021 and more than 21,000 Americans have died after becoming part of the largest human experiment in history.

The mistrust the public is experiencing is due to the extreme measures that have been taken against the people and coercive unethical measures that have not been supported by the actual data:

<https://gcc02.safelinks.protection.outlook.com/?url=https%3A%2F%2Fcdc.gov%2Fdata-tracker%2F%23trends_dailycases&data=04%7C01%7Ckaitlyn.donahoe%40sboh.wa.gov%7Cd160812d799

https://covid.cdc.gov/covid-data-tracker/#trends_dailycases

People are informed, aware, and very unhappy that medical procedures are being mandated and yet have not proven to stop the spread, stop transmission, nor stop hospitalization as was touted in the beginning of rolling out these vaccines. People are also aware of fraudulently hyperinflates numbers of unvaccinated cases due to a new definition of 'fully vaccinated' as per Jan 5th, 2022, which refers to 'Fully Vaccinated & Boosted' vs "Fully Vaccinated" & "Not Boosted, Partially Vaccinated", "Vaccine Free". Vaccine breakthrough cases increased by over 1.1 million confirmed breakthrough cases from November to December, which explains fraudulent statistics given to the American people.

With so many risks and little benefit, i, along with many others, intend to hold those responsible for bringing forth the mandate for Covid-19 vaccines to all students and any potential health damage. I ask you to consider the repercussions of force, mandates, and new laws that hurt the freedoms afforded us by God or the ones supported by the US Constitution. It is our privilege and duty to protect our children from any and all harm.

So, i urge you to vote from your innermost consciousness, with regards to data and with a Precautionary Principle in mind. Do not follow the directives and social pressure from the institutions that might be implicated in willful misconduct. Ask yourself: What Would Consciousness Do?

i, sincerely thank you for your community service. It is only because of the people on the ground, like you and i, that real change is ever possible. i, sincerely believe that this still holds true! Thank you once again for honoring the Hippocratic Oath, Nuremberg Code and Precautionary Principle by voting NO.

Sincerely,

by: Vija Rogozina

Subject: My Public Comments...Regarding Proposed Final Agenda for January 12 Public Meeting...11. Rulemaking Petition – Chapter 246-105 WAC, Immunization Criteria, Child Care and School Entry –Possible Action

Written Notice of Liability for Washington State Board of Health

Notice to Agents is Notice to Principals; Notice to Principals is Notice to Agents

Good Day,

I would like to emphasize that I am your neighbor. I bear you no ill will and presume you are all decent, well-intentioned people.

Every policy that you have enacted or enabled under the guise of COVID-19 that denies people - living men, women, boy and girls - equal access to public accommodations unless they submit to long-term wearing of masks, invasive diagnostic testing, or injections of gene-modification therapies is unlawful.

First, people are divine creations and are only bound by divine law, not by man's law. The first sentence of the first law of this country, the Declaration of Independence, states this clearly: "Men [and women] are endowed by their Creator with unalienable rights." These are absolute and unconditional. What is given by our Creator cannot be taken away by you. The supreme court has upheld this countless times. Your coercive policies violate our unalienable rights under the pretense of law.

Second, all three of these policies involve medical procedures. In 1947 civilized society declared in Article 1 of the Nuremberg Code that this type of coercion is everywhere and always a crime against humanity.

Policies relating to COVID-19 and Pierce County Resolution No. R2021-224 are violations of the 1st, 4th, 5th, and 9th Articles of the Bill of Rights and are by definition Rape, Bodily Invasion, Abduction, Abuse, Molestation and Maltreatment at the very least.

This is a betrayal of your allegiance to the Constitution for the united States of America, and thus to us, it's beneficiaries. Your polices, therefore, are a breach of fiduciary duty and treason.

You have not been granted permission to pass such mandates as proposed.

I do not grant you permission to proceed with passing such mandates.

If you do not comply with this cease and desist direction, I will hold each and every one of you accountable for these deprivations of rights, crimes against humanity, and treason.

Please understand that I have every remedy available to me.

Your individual liability is unlimited.

You have now been offered lawful Notice of due process.

alissa-karin:ray-keough, sui juris

Dear Michelle Davis, All Washington State Board of Health Members and Executives,

On January 6, 2022, I sent you an email as a written Verbal Notice of Liability for Washington State Board of Health. (see attached)

Under Federal Rules of Evidence 902 once I record this Notice it is self-authenticating. Your failure to rebut is admission to the truth of the Affirmations and judgment on the Remedy contained therein without your or your agent's objection due to estoppel by acquiescence.

Every policy that you have enacted or enabled under the guise of COVID-19 that denies people - living men, women, boy and girls - equal access to public accommodations unless they submit to long-term wearing of masks, invasive diagnostic testing, or injections of gene-modification therapies is unlawful.

First, people are divine creations and are only bound by divine law, not by man's law. The first sentence of the first law of this country, the Declaration of Independence, states this clearly: "Men [and women] are endowed by their Creator with unalienable rights." These are absolute and unconditional. What is given by our Creator cannot be taken away by you. The supreme court has upheld this countless times. Your coercive policies violate our unalienable rights under the pretense of law.

Second, all three of these policies involve medical procedures. In 1947 civilized society declared in Article 1 of the Nuremberg Code that this type of coercion is everywhere and always a crime against humanity.

Policies relating to COVID-19 are violations of the 1st, 4th, 5th, and 9th Articles of the Bill of Rights and are by definition Rape, Bodily Invasion, Abduction, Abuse, Molestation and Maltreatment at the very least.

This is a betrayal of your allegiance to the Constitution for the united States of America, and thus to us, it's beneficiaries. Your polices, therefore, are a breach of fiduciary duty and treason.

You have not been granted permission to pass such mandates as proposed.

I do not grant you permission to proceed with passing such mandates.

If you do not comply with the direction, you have just been given, I will hold each and every one of you accountable for these deprivations of rights, crimes against humanity, and treason.

Please understand that I have every remedy available to me.

Your individual liability is unlimited.

You have now been offered lawful Notice of due process.

You have a further ten (10) business days from the date of this Notice to cure your breach of Notice of Liability and to do so by January 25, 2022.

If you do not, I will immediately provide you and all the members of the Washington State Board of Health with the following, without limitation:

1. Complaints against your faithful performance bonds
2. Criminal referrals under Title 18 US code 241-242
3. Civil action for deprivation of rights
4. Demand for a common law grand jury dependent upon the results of the foregoing.

I reserve all rights and remedies available to me in any jurisdiction or venue.

By alissa karin ray-keough

Subject: Commit to no COVID vaccine mandates on children

External Email

Dear Washington State Board of Health,

Our state government should NOT be mandating Covid vaccines on our children. Children are at extremely low risk for Covid and these medical decisions should be left in the hands of parents.

Sincerely,

The Citizens of Washington State

Subject: UNMASK THE CHILDREN

External Email

Hello,

Please unmask the children now.

How many more studies do we need to show that masks have no or very little efficacy in preventing spread?

How many more children must harm themselves before the mask wearing is finished?

How many more children must kill themselves before the mask wearing is finished?

What are we doing? You can judge a nation by how it treats their children, this is just sick. Covid has officially become a cult.

We can't move on with our lives because of the Board of Health and Governor Inslee's draconian policy.

How many vaccinated people and previously infected people combined will it take to remove the mandates?

Why is natural immunity not recognized?

Why isn't the data transparent and shown with reasonable justification to support the policies?

The public health and treatment policies have done more to harm people than Covid has, multiple studies support this claim.

More states continue to drop mandates, why not Washington?

Everyone and I mean everyone knows we are being lied to with data and power hungry corrupt politicians and policy.

You have officially lost any and all educated and reasonably minded individuals with these continued policies.

These policies are killing business, trust, culture, and our children's psychological states.

My children and the rest of the children in this state are suffering, because of the policy. Covid not so much, it was a cold.

Why is the "worst virus" in history also the most politicized?

Are we hell bent on protecting people or destroying society?

Every policy, mandate. And action has done nothing to slow the spread. Has the motive become clear?

END IT NOW, ENOUGH IS ENOUGH.

Open the state, open the schools, take off the masks, and give people their lives back. Those who remain scared can stay at home and wear 5 masks at a time and get a booster every 6 months.

For the sake of your state and country, call for resignations or END IT ALL?

Sincerely,

A parent of children you are hurting.

External Email

Dear Board Members,

I did not see a place to comment about the idea of mandating the COVID vaccine for kids. I would like to voice my opinion against that, as I would not send my kids to school if that becomes a requirement. With similar viral loads in both unvaccinated and vaccinated populations, this does not make sense from a public health standpoint. Furthermore, this vaccine is experimental and we have no idea what the long term consequences will be as these children become adults. The decision to put this vaccine into a child should be between parents and doctors, not the state.

Thank you for hearing my concerns,

Marina Smith

I am writing you to ask why mandates are not being lifted? There is no reason for it not to unless you are like Justin Trudeau and are trying to cause segregation and division. The governor did call the unvaccinated terrorists, so maybe that is the plan. I live in the same place as the governor, I probably shop in the same grocery store. All I have seen happening is more and more judgment. More and more either you are on our side or you are less than the dirt on my shoes. The rest of America is getting back to life, building bridge and trying to bring communities together. Sadly I see none of that here. Sadly I see neighbor suspicious of neighbor. We were the first to go in lockdown, will we be the last to come out of it? I have lived in WA for 31 years and now I think I will have to find a new state to call home. Please lift mandates, please end segregation. Thank you Clarice

PS if you haven't, I suggest you read John Hopkins latest study on covid measures

Good morning BOH team -

I share a reminder of something we all know deep down.

God has placed the governance of the family with the family. Parents are His hierarchical representatives for children (Deuteronomy 6).

There is an eternal state of judgement and rewards and we will be held accountable for every deed (2 Corinthians 5:10). Usurped authority and supporting the deception of a propped up narrative will not receive a free pass now or eternally.

You each know individually there is no need to have COVID-19 vaccines for children. You know it is a benign disease that is inconsequential for children. You know that any suggestion otherwise is an egregious sacrifice of children for selfish gain. You know the narrative supporting this has fallen apart and is abandoned in most of our country and in many countries across the world.

Even if you are the only one, stand up for kids because Jesus is King not Caesar (Matthew 28:18, Revelation 1:5).

In truth and love,

J Huffman

Hello. I just wanted to add my vote in support of having vaccinations for school students (and teachers). This definitely includes COVID shots, as long as we are in a pandemic situation. When we reach the stage where COVID is acting like a flu, then we should consider removing it from "required".

I will also add my opinion on the masks. I know they are unpopular with many... but as a 28 year educator... having everyone wear masks this year cut out on so many more "bad bugs" than COVID. My annual Strep Throat did not happen, two years in a row! Wiping desks down and masking has helped keep attendance up. You will never keep it up, but I'm just wishful thinking that we could.

Thanks.

Christine McKinnon
